## Attention related to safety (Read carefully before application)

⊙ For the purpose of ensuring your personal safety and protecting this product and its peripheral equipment, read this manual regarding the safety functions carefully before installation and operation of the WSZ controller. The three safety categories of this manual are classified into Danger, Warning, Caution grades according to the danger level and are preceded by the “ ! ” symbol. Following is their description:

Indicates casualty or serious damage or property loss will result if the correct instruction was not followed.

Casualty or serious damage or property loss may result if the correct instruction was not followed.

Indicates minor damage or property loss will result if the correct instruction was not followed.

⊙ This manual is a guideline for qualified personnel on how to install the WSZ controller correctly and use it safely. The qualified personnel stated here means professional electromechanical engineering personnel who is familiar with safety specifications and methods of grounding, circuit wiring, peripheral equipment system etc. and possesses practical experience.

⊙ Keep in mind before using the controller

Abnormality in the external power supply or failure of the controller itself will result in the controller or the complete system emerging in an unsafe status, and may cause unpredictable actions. Such actions may cause human injury, death, or serious damage of the unit itself. Thus, please design a separate external safety protection circuit, such as emergency stop circuit, machine replacement device, or redundant safety protection circuit in your application with the following safety considerations:

1. Emergency stop circuit, safety protection circuit, motor positive/reverse interlock circuit, upper/lower limit destruction prevention circuit of position control, etc. These circuits should be hardwired and external to the controller.
2. The controller is unable to detect the abnormality of the input signal circuit (such as overload or interrupted controller input circuit. The controller interprets them as OFF, then erroneous output may result in the controller and may cause major safety problems, thus external detection and protection circuits should be provided in addition to the controller.
3. The output components of the controller such as transistor, relay are possible to cause permanent ON or OFF and resulting in serious accidents, thus protection by additional external circuits or mechanisms is necessary for the output points to avoid major safety problems.

### Contents

#### Chapter 1: Introduction of FUJI WSZ Series Controller

1.1 Appearance of Main Unit .....	H1-1
1.2 Appearance of Expansion Unit/Module .....	H1-2
1.3 List of WSZ Models .....	H1-4
1.4 Specifications of Main Unit .....	H1-5
1.5 Environmental Specifications .....	H1-7
1.6 Connection Diagrams of Various Models .....	H1-7
1.6.1 Main Unit .....	H1-7
1.6.2 Digital I/O Expansion Unit .....	H1-8
1.6.3 Digital I/O Expansion Module .....	H1-8
1.6.4 Analog I/O Expansion Module .....	H1-9
1.6.5 Temperature Input Module .....	H1-9
1.6.6 Communication Board (CB) .....	H1-9
1.7 Drawings with External Dimensions .....	H1-10

#### Chapter 2: System Architecture

2.1 Single-Unit System of WSZ Controller .....	H2-1
2.2 Formation of Multi-Unit System .....	H2-2
2.2.1 Connection of Multiple WSZ-Controller (CPU Link) .....	H2-2
2.2.2 Connection WSZ-Controller with Host Computer or Intelligent Peripherals .....	H2-3

#### Chapter 3: Expansion of WSZ Controller

3.1 I/O Expansion .....	H3-1
3.1.1 Digital I/O Expansion and I/O Numbering .....	H3-1
3.1.2 Numeric I/O Expansion and I/O Channel Mapping .....	H3-3
3.2 Expansion of Communication Port .....	H3-4

## Chapter 4: Installation Guide

4.1	Installation Environment.....	H4-1
4.2	Precautions of Controller Installation.....	H4-1
4.2.1	Placement of Controller.....	H4-1
4.2.2	Ventilation Space.....	H4-2
4.3	Fixation by DIN RAIL.....	H4-3
4.4	Fixation by Screws.....	H4-4
4.5	Precautions on Construction and Wiring.....	H4-5

## Chapter 5: Power Supply Wiring, Power Consumption Calculation, and Power Sequence Requirements

5.1	Specifications of AC Power Sourced Power Supply and Wiring.....	H5-1
5.2	Residual Capacity of Main/Expansion Unit & Current Consumption of Expansion Module .....	H5-3
5.2.1	Residual Capacity of Main/Expansion Unit.....	H5-3
5.2.2	Maximum Current Consumption of Expansion Module.....	H5-3
5.3	Requirement of Power Sequence in Main Unit & Expansion Unit/Module.....	H5-4

## Chapter 6: Digital Input (DI) Circuit

6.1	Specifications of Digital Input (DI) Circuit.....	H6-1
6.2	24VDC Single-End Input Circuit and Wiring for SINK/SRCE Input.....	H6-2

## Chapter 7: Digital Output (DO) Circuit

7.1	Specifications of Digital Output Circuit.....	H7-2
7.2	Single-End Output Circuit.....	H7-2
7.2.1	Structure and Wiring of Single-End Relay Output Circuit.....	H7-3
7.2.2	Structure and Wiring of Single-End Transistor SINK Output Circuit.....	H7-4
7.3	Speed Up the Single-End Transistor Output Circuit.....	H7-4
7.4	Output Device Protection and Noise Suppression in DO Circuit.....	H7-5
7.4.1	Protection of Relay Output and Noise Suppression.....	H7-5
7.4.2	Protection of Transistor Output and Noise Suppression.....	H7-6

## Chapter 8: Test Run, Monitoring and Maintenance

8.1	Inspection after Wiring and before First Time Power on.....	H8-1
-----	---	------

8.2 Test Run and Monitoring .....H8-1

8.3 LED Indicators on Controller Main Unit and Troubleshooting .....H8-2

8.4 Maintenance.....H8-4

8.5 The Charge of Battery & Recycle of Used Battery.....H8-4

### Contents

#### Chapter 1: PLC Ladder Diagram

1.1 The Operation Principle of Ladder Diagram	1-1
1.1.1 Combination Logic	1-1
1.1.2 Sequential Logic	1-2
1.2 Differences Between Conventional and PLC Ladder Diagram	1-3
1.3 Ladder Diagram Structure and Terminology	1-5

#### Chapter 2: WSZ Controller Memory Allocation

2.1 WSZ Controller Memory Allocation	2-1
2.2 Digital and Register Allocations	2-2
2.3 Special Relay Details	2-3
2.4 Special Registers Details	2-8

#### Chapter 3: WSZ-Controller Instruction Lists

3.1 Sequential Instructions	3-1
3.2 Function Instructions	3-2

#### Chapter 4: Sequential Instructions

4.1 Valid Operand of Sequential Instructions	4-1
4.2 Element Description	4-2
4.2.1 Characteristics of A, B, TU and TD Contacts	4-2
4.2.2 OPEN and SHORT Contact	4-3
4.2.3 Output Coil and Inverse Output Coil	4-4
4.2.4 Retentive Output Coil	4-4
4.2.5 Set Coil and Reset Coil	4-5
4.3 Node Operation Instructions	4-5

## Chapter 5: Descriptions of Function Instructions

5.1	The Format of Function Instructions .....	5-1
5.1.1	Input Control .....	5-1
5.1.2	Instruction Number and Derivative Instructions .....	5-2
5.1.3	Operand .....	5-3
5.1.4	Functions Output (FO).....	5-6
5.2	Use Index Register(XR) for Indirect Addressing .....	5-6
5.3	Overflow and Underflow of Increment(+1) or Decrement(-1) .....	5-9
5.4	Carry and Borrow in Addition/Subtraction .....	5-10

## Chapter 6: Basic Function Instructions

●	TIMER	(T) .....	6-2
●	COUNTER	(C).....	6-5
●	SET	(SET) .....	6-8
●	RESET	(RST) .....	6-10
●	MASTER CONTROL LOOP START	(FUN0) .....	6-12
●	MASTER CONTROL LOOP END	(FUN1) .....	6-14
●	SKIP START	(FUN2) .....	6-15
●	SKIP END	(FUN3) .....	6-17
●	DIFFERENTIAL UP	(FUN4) .....	6-18
●	DIFFERENTIAL DOWN	(FUN5) .....	6-19
●	BIT SHIFT	(FUN6) .....	6-20
●	UP/DOWN COUNTER	(FUN7) .....	6-21
●	MOVE	(FUN8) .....	6-23
●	MOVE INVERSE	(FUN9) .....	6-24
●	TOGGLE SWITCH	(FUN10) .....	6-25
●	ADDITION	(FUN11) .....	6-26
●	SUBTRACTION	(FUN12) .....	6-27
●	MULTIPLICATION	(FUN13) .....	6-28
●	DIVISION	(FUN14) .....	6-30
●	INCREMENT	(FUN15) .....	6-32
●	DECREMENT	(FUN16) .....	6-33
●	COMPARE	(FUN17) .....	6-34
●	LOGICAL AND	(FUN18) .....	6-35
●	LOGICAL OR	(FUN19) .....	6-36
●	BIN TO BCD CONVERSION	(FUN20) .....	6-37

- BCD TO BIN CONVERSION (FUN21) ..... 6-38

## Chapter 7: Advanced Function Instructions

- BREAK FROM FOR AND NEXT LOOP (FUN22) ..... 7-1
- 48-BIT DIVISION (FUN23) ..... 7-2
- SUM (FUN24) ..... 7-3
- MEAN (FUN25) ..... 7-4

- BYTE UNITE (FUN49) ..... 7-37
- BYTE DISTRIBUTE (FUN50) ..... 7-38
- SHIFT LEFT (FUN51) ..... 7-39
- SHIFT RIGHT (FUN52) ..... 7-40
- ROTATE LEFT (FUN53) ..... 7-41
- ROTATE RIGHT (FUN54) ..... 7-42

● BINARY-CODE TO GRAY-CODE CONVERSION	(FUN55) .....	7-43
● GRAY-CODE TO BINARY-CODE CONVERSION	(FUN56) .....	7-45
● DECODE	(FUN57) .....	7-47
● ENCODE	(FUN58) .....	7-48
● 7-SEGMENT CONVERSION	(FUN59) .....	7-50
● ASCII CONVERSION	(FUN60) .....	7-53
● HOUR : MINUTE : SECOND TO SECONDS CONVERSION	(FUN61) .....	7-54
● SECOND→HOUR : MINUTE : SECOND	(FUN62) .....	7-55
● CONVERSION OF ASCII CODE TO HEXADECIMAL VALUE	(FUN63) .....	7-56
● CONVERSION OF HEXADECIMAL VALUE TO ASCII CODE	(FUN64) .....	7-58
● PROGRAM END	(END) .....	7-60
● LABEL	(FUN65) .....	7-61
● JUMP	(FUN66) .....	7-62
● CALL	(FUN67) .....	7-63
● RETURN FROM SUBROUTINE	(FUN68) .....	7-64
● RETURN FROM INTERRUPT	(FUN69) .....	7-65
● FOR	(FUN70) .....	7-66
● LOOP END	(FUN71) .....	7-67
● IMMEDIATE I/O	(FUN74) .....	7-68
● DECIMAL-KEY INPUT	(FUN76) .....	7-69
● HEX-KEY INPUT	(FUN77) .....	7-71
● DIGITAL SWITCH INPUT	(FUN78) .....	7-72
● 7-SEGMENT OUTPUT WITH LATCH	(FUN79) .....	7-73
● MULTIPLEX INPUT	(FUN80) .....	7-75
● PULSE OUTPUT	(FUN81) .....	7-76
● PULSE WIDTH MODULATION	(FUN82) .....	7-78
● SPEED DETECTION	(FUN83) .....	7-79
● 7/16-SEGMENT DISPLAY CHARACTER AND NUMBER DISPLAY CONVERSION	(FUN84) .....	7-80
● PID TEMPERATURE CONTROL INSTRUCTION	(FUN86) .....	7-82
● CUMULATIVE TIMER	(FUN87 ~89) .....	7-84

● WATCHDOG TIMER	(FUN90)	7-86
● RESET WATCHDOG TIMER	(FUN91)	7-87
● HARDWARE HIGH SPEED COUNTER CURRENT VALUE(CV) ACCESS	(FUN92)	7-88
● HARDWARE HIGH SPEED COUNTER CURRENT VALUE AND PRESET VALUE WRITING	(FUN93)	7-89
● ASCII WRITE	(FUN94)	7-90
● RAMP FUNCTION FOR D/A OUTPUT	(FUN95)	7-92
● TRACKING TYPE RAMP FUNCTION FOR D/A OUTPUT	(FUN98)	7-94
● REGISTER TO TABLE MOVE	(FUN100)	7-99
● TABLE TO REGISTER MOVE	(FUN101)	7-100
● TABLE TO TABLE MOVE	(FUN102)	7-101
● BLOCK TABLE MOVE	(FUN103)	7-102
● BLOCK TABLE SWAP	(FUN104)	7-103
● REGISTER TO TABLE SEARCH	(FUN105)	7-104
● TABLE TO TABLE COMPARE	(FUN106)	7-105
● TABLE FILL	(FUN107)	7-106
● TABLE SHIFT	(FUN108)	7-107

## Chapter 8: Step Instruction Description

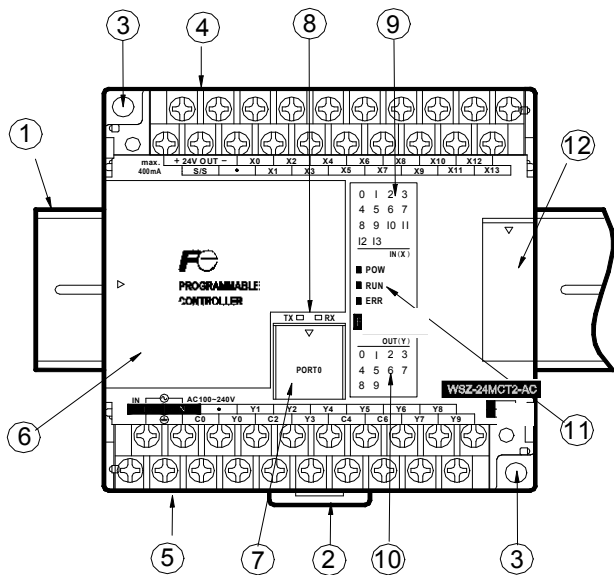

8.1	The Operation Principle of Step Ladder Diagram .....	8-1
8.2	Basic Formation of Step Ladder Diagram .....	8-2
8.3	Introduction of Step Instructions: STP, FROM, TO, and STPEND .....	8-5
8.4	Notes for Writing a Step Ladder Diagram .....	8-11
8.5	Application Examples .....	8-15
8.6	Syntax Check Error Codes for Step Instruction.....	8-22

## Chapter 1 Introduction of WSZ Series Controller

The FUJI WSZ Series controller is a new generation of controller equipped with excellent functions comparable to medium or large controller, with up to three communication ports. The maximum I/O numbers are 256 points for Digital Input (DI) and Digital Output (DO), 64 words for Numeric Input (NI) and Numeric Output (NO). The Main Units of WSZ are available in MC type (High-Performance Type). With the combination of I/O point ranges from 24 to 60, a total of 4 models are available. 14DI/10DO (WSZ-24XYT-AC), 16DO (WSZ-16YR), 6ch AI (WSZ-6AD), 2ch AO (WSZ-2DA), 4ch AI+2ch AO (WSZ-4A2D), 16ch temperature measurement (WSZ-16TC) models are available for Expansion Units/Modules. With interface options in RS232 and RS485, the communication peripherals are available with one board. The various models are described in the following:

### 1.1 Appearance of Main Unit

All the Main Units of WSZ controller have the same physical structure. The only difference is the case width. There are three different case sizes, which are 90mm, 130mm, and 175mm. The figure below will use the Main Unit case of the WSZ-24MCT2-AC as an example for illustration:

(Front view without Communication Board)

(Front view with cover plate removed)

(Front view with CB-25 Board installed)

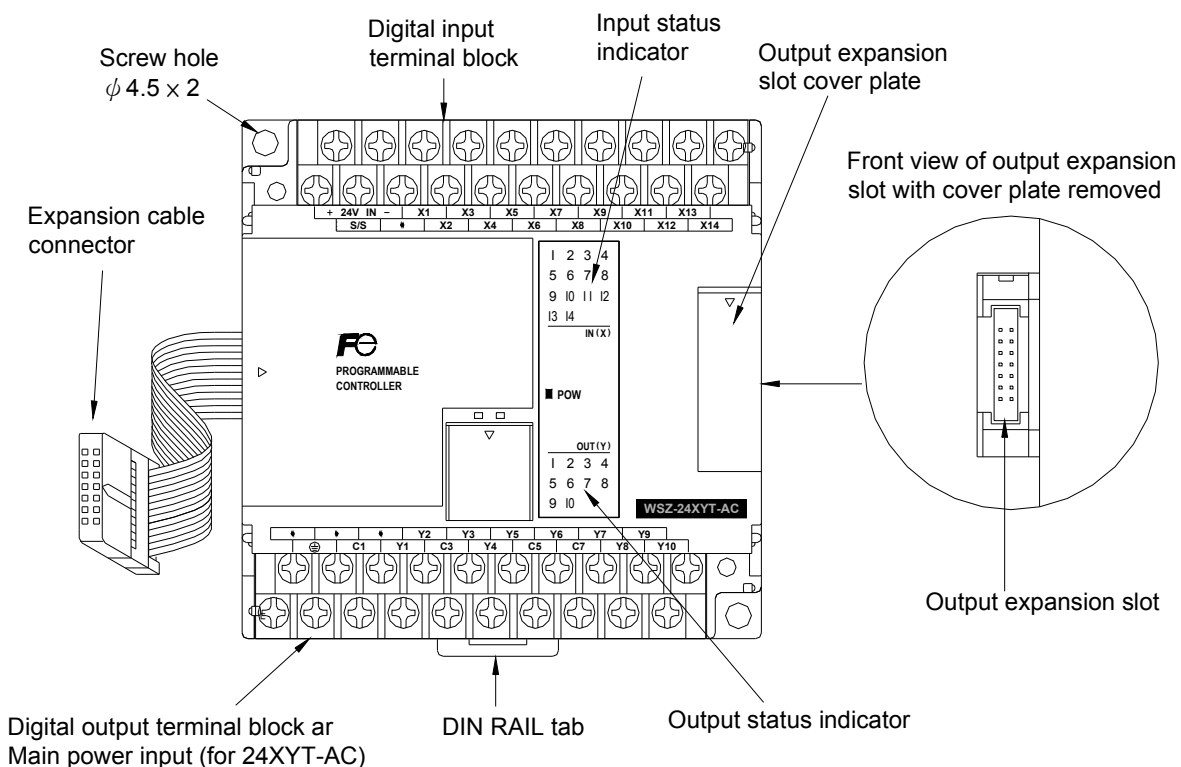

- ① 35mm-width DIN RAIL
- ② DIN RAIL tab
- ③ Hole for screw fixation ( $\varphi 4.5 \times 2$ )
- ④ Terminal of 24VDC power output and digital input (Pitch 7.62mm)
- ⑤ Terminal of main power input and digital output (Pitch 7.62mm)
- ⑥ Standard cover plate (Without communication board)
- ⑦ Cover plate of build-in communication port (Port0)

- ⑧ Indicators for transmit (TX) and receive (RX) status of build-in communication port (Port0)
- ⑨ Indicators for Digital Input (Xn)
- ⑩ Indicators for Digital Output (Yn)
- ⑪ Indicators for system status (POW, RUN, ERR)
- ⑫ I/O output expansion header cover [units of 20 points or beyond only], with esthetic purpose and capable of securing expansion cable
- ⑬ RS232 communication port (Port1)
- ⑭ RS485 communication port (Port2)
- ⑮ WSZ-CB25 Communication Board (CB)
- ⑯ Screw holes of communication board
- ⑰ Connector for communication board
- ⑱ Connector for Memory Pack
- ⑲ Connector for build-in RS232 communication port (Port0)
- ⑳ I/O output expansion header, for connecting with cables from expansion units/modules

## 1.2 Appearance of Expansion Unit/Module

There are two types of cases for expansion unit/modules. One type uses the same case as main unit that of the 90mm, while the other have thinner 40mm case, which are for expansion modules. All expansion cables (left) of expansion units/modules are flat ribbon cables (5cm long), which were soldered directly on the PCB, and the expansion header (right) is a 14Pin Header, with this to connect the right adjacent expansion units/modules. In the following, each of the two types of expansion units/modules is described as an example:

- Expansion unit with 90mm width case: [-24XYT-AC, -16TC]

- Expansion module with 60mm width case: [-16YR]

- Expansion module with 40mm width case: [-6AD, -2DA, -4A2D]

### 1.3 List of WSZ Models

Item Name	Model	Specifications
Main Units	WSZ-24MCT2-AC	100~240VAC power supply ; 14 points 24VDC digital input (4 points 200kHz high speed, 4 points 20kHz medium speed, 6 points medium speed total 5kHz); 10 points transistor sink output (4 points 200kHz high speed, 4 points 20kHz medium speed); RS232 port ; build-in RTC; detachable terminal block
	WSZ-32MCT2-AC	100~240VAC power supply ; 20 points 24VDC digital input (6 points 200kHz high speed, 2 points 20kHz medium speed, 8 points medium speed total 5kHz); 12 points transistor sink output (6 points 200kHz high speed, 2 points 20kHz medium speed); RS232 port ; build-in RTC; detachable terminal block
	WSZ-40MCT2-AC	100~240VAC power supply ; 24 points 24VDC digital input (6 points 200kHz high speed, 2 points 20kHz medium speed, 8 points medium speed total 5kHz); 16 points transistor sink output (6 points 200kHz high speed, 2 points 20kHz medium speed); RS232 port ; build-in RTC; detachable terminal block
	WSZ-60MCT2-AC	100~240VAC power supply ; 36 points 24VDC digital input (8 points 200kHz high speed, 8 points medium speed total 5kHz); 24 points transistor sink output (8 points 200kHz high speed); RS232 port ; build-in RTC; detachable terminal block
Digital(DIO) Expansion Unit	WSZ-24XYT-AC	14 points 24VDC digital input, 10 points transistor sink output, build-in power supply
Digital(DIO) Expansion Module	WSZ-16YR	16 points relay output
Analog Expansion Modules	WSZ-2DA	2 channels, 14-bit analog output module (-10V~0V~+10V or -20mA~0mA~+20mA)
	WSZ-6AD	6 channels, 14-bit analog input module (-10V~0V~+10V or -20mA~0mA~+20mA)
	WSZ-4A2D	4 channels, 14-bit analog input (same specification as WSZ-6AD) + 2 channels, 14-bit analog output (same specification as WSZ-2DA) combo module
Temperature Measurement Module	WSZ-16TC	16 channels, thermocouple temperature input module with 0.1°C resolution
Communication Expansion Board	WSZ-CB25	1 port RS232 (Port 1) + 1 port RS485 (Port 2) communication board
Communication Cables	WSZ-232P0-9F-150	WSZ main unit port 0 RS232 to 9 pins female D-Sub communication cable, length 150cm
	WSZ-232P0-9M-400	WSZ main unit port 0 RS232 to 9 pins male D-Sub communication cable, length 400cm
Memory Pack	WSZ-PACK	WSZ program memory pack with 20K words program, 20K words register, write protection switch
Programming Device	Winproladder for WSZ	WSZ Winproladder Programming software for Windows XP and 7 (32 bits)

## 1.4 Specifications of Main Unit

“\*” Default Settings

Item		Specification				Note	
Execution Speed		0.33us per Sequence Command					
Space of Control Program		20K Words					
Program Memory		SRAM + Lithium Battery for Back-up				Option: FLASH ROM	
Sequence Command		36					
Application Command		326 (126 types)				Include Derived Commands	
Flow Chart (SFC) Command		4					
Single Point 《BIT Status》	X	Input Contact (DI)		X0~X255 (256)		Corresponding to External Digital Input Point	
	Y	Output Relay (DO)		Y0~Y255 (256)		Corresponding to External Digital Output Point	
	TR	Temporary Relay		TR0~TR39 (40)			
	M	Internal Relay	Non-Retentive	M0~M799 (800)*		Can be configured as retentive type	
			Retentive	M1400~M1911 (512)			
		Special Relay	M1912~M2001 (90)		Can be configured as non-retentive type		
	S	Step Relay	Non-Retentive	S0~S499 (500)*		S20~S499 can be configured as retentive type	
			Retentive	S500~S999 (500)*		Can be configured as non-retentive type	
T	Timer “Time Up” Status Contact		T0~T255 (256)				
C	Counter “Count Up” Status Contact		C0~C255 (256)				
Register 《WORD Data》	TMR	Current Time Value Register	0.01s Time base	T0~T49 (50)*		T0~T255 Numbers for each time base can be flexibly adjusted

	Captured pulse width	> 47 $\mu$ s (medium speed input) > 470 $\mu$ s (mid/low speed input)			
Setting of Digital Filter	X0~X15	Frequency 14KHz~1.8MHz		Chosen by frequency at high frequencies	
		Time constant 0~1.5ms/0~15ms, adjustable by step of 0.1ms/1ms		Chosen by time constant at low frequencies	
	X16~X35	Time constant 1ms~15ms, adjustable by step of 1ms			
Maximum expandable modules		32			

## 1.5 Environmental Specifications

Item		Specification		Note
Operation Ambient Temperature	Enclosure equipment	Minimum	5°C	Permanent Installation
		Maximum	40°C	
	Open equipment	Minimum	5°C	
		Maximum	55°C	
Storage Temperature			-25°C~+70°C	
Relative Humidity (non-condensing, RH-2)			5%~95%	
Pollution Level			Degree II	
Corrosion Resistance			Base on IEC-68 Standard	
Altitude			≤ 2000m	
Vibration	Fixated by DIN RAIL		0.5G, for 2 hours each along the 3 axes	
	Secured by screws		2G, for 2 hours each along the 3axes	
Shock			10G, 3 times each along the 3 axes	
Noise Suppression			1500Vp-p, width 1us	
Withstand Voltage			1500VAC, 1 minute	L, N to any terminal

### Warning

The listed environmental specifications are for WSZ controller under normal operation. Any operation in not conform to above conditions should be consulted with FUJI.

## 1.6 Connection Diagrams of Various Models

### 1.6.1 Main Unit [7.62mm Terminal Block, detachable in model]

- 24 point digital I/O main unit (14 points IN, 10 points OUT)

- 32 point digital I/O main unit (20 points IN, 12 points OUT)

- 40 point digital I/O main unit (24 points IN, 16 points OUT)

- 60 point digital I/O main unit (36 points IN, 24 points OUT)

### 1.6.2 Digital I/O Expansion Unit [7.62mm fixed terminal block]

- 24 point digital I/O expansion unit (14 points IN, 10 points OUT)

### 1.6.3 Digital I/O Expansion Module [7.62mm fixed terminal block]

- 16 point digital I/O expansion module (16 points OUT)

**1.6.4 Analog I/O Expansion Module** [7.62mm fixed terminal block]

- 6 channel A/D analog input module
- 2 channel D/A output module

- 4 channel A/D input, 2 channel D/A output module

**1.6.5 Temperature Input Module** [7.62mm fixed terminal block]

- 16 channel thermocouple input module

**1.6.6 Communication Board (CB)** [DB9F/3Pin plug able terminal block] (Below is outlook of CB and the corresponding cover plate)

- 1 RS232 + 1 RS485 ports

WSZ-CB25

## 1.7 Drawings with External Dimensions

### (1) Outlook I:

Expansion Module: WSZ-16YR

### (2) Outlook II:

Main Unit: WSZ-24MCT2-AC, WSZ-32MCT2-AC, WSZ-40MCT2-AC, WSZ-60MCT2-AC

Expansion Unit/Module: WSZ-24XYT-AC, WSZ-16TC

W	Model
90mm	WSZ-24MCT2-AC, WSZ-24XYT-AC, WSZ-16TC
130mm	WSZ-32MCT2-AC, WSZ-40MCT2-AC
175mm	WSZ-60MCT2-AC

(3) Outlook III:

Expansion Module: WSZ-6AD, WSZ-2DA, WSZ-4A2D

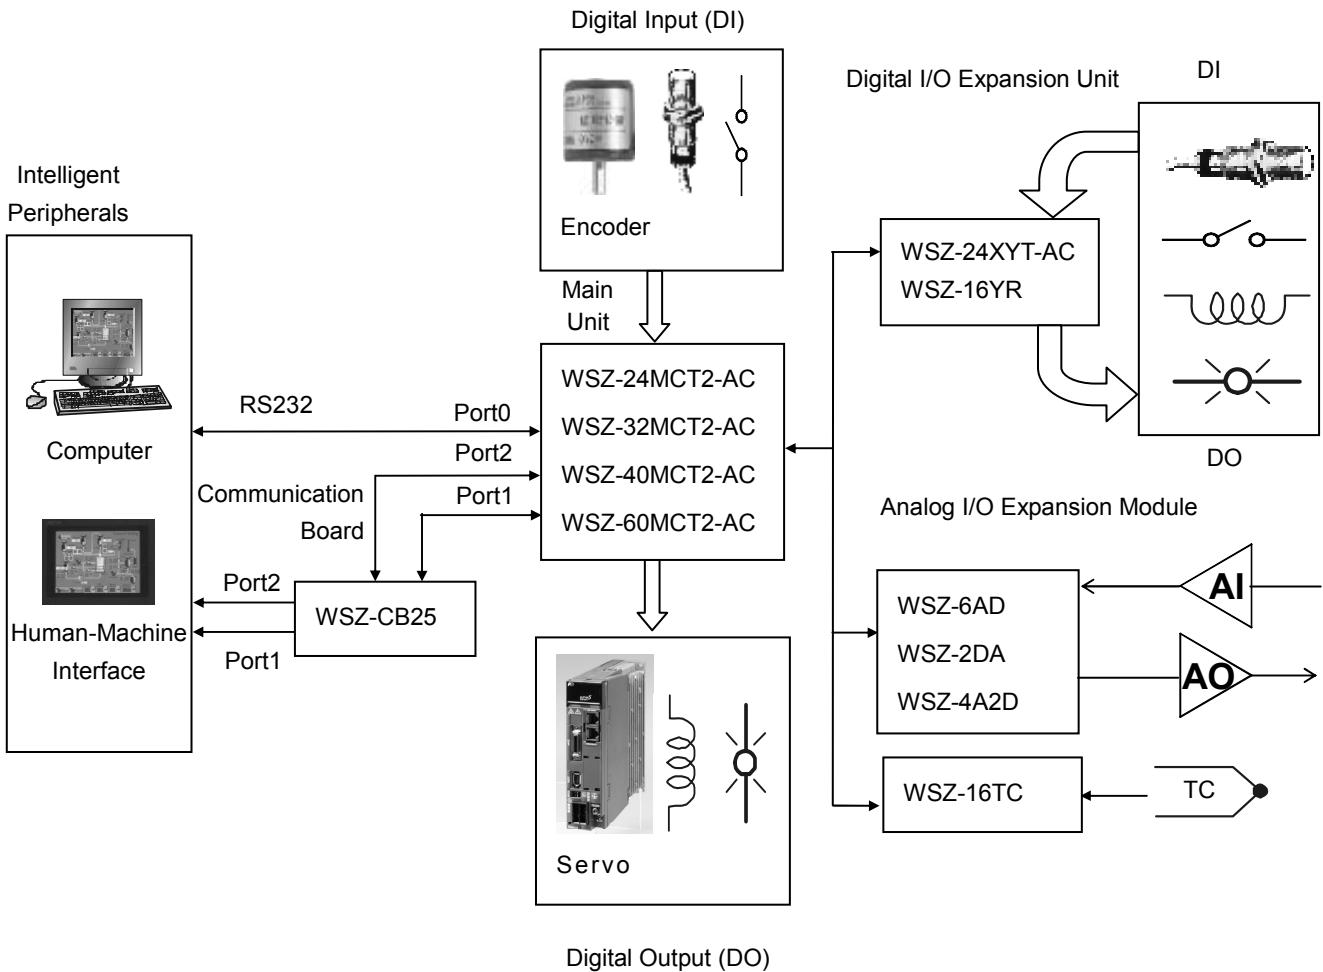

Units: mm

# Chapter 2 System Architecture

## 2.1 Single-WSZ Controller

The Single-Unit system means a system built only by a single WSZ controller and its expansion unit/modules and communication board. Such system has a limited capability, incorporate CPU communication via LINK function for expansions. The figure below shows the block diagram of the Single-Unit system of WSZ controller, where, besides the available main units, the available communication peripherals resources and I/O expansion resources are depict on the left and the right respectively.

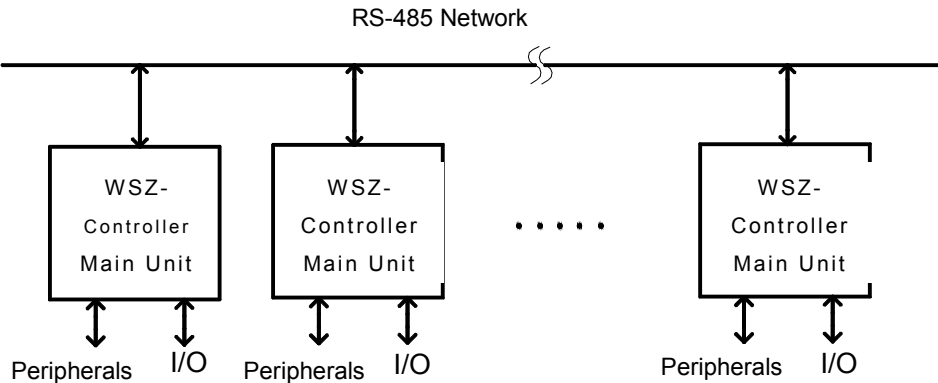

For the I/O of WSZ controller, it can achieve a maximum of 256 point digital input (DI), 256 point digital output (DO), 64 word numeric inputs (NI), and 64 word numeric outputs (NO).

Regarding communication resources, the WSZ-controller hardware can accommodate up to 3 communication ports (with a maximum speed of 921.6Kbps). In addition to providing the original communication protocol, it also supports the Modbus master/slave protocol or any user-defined protocol.

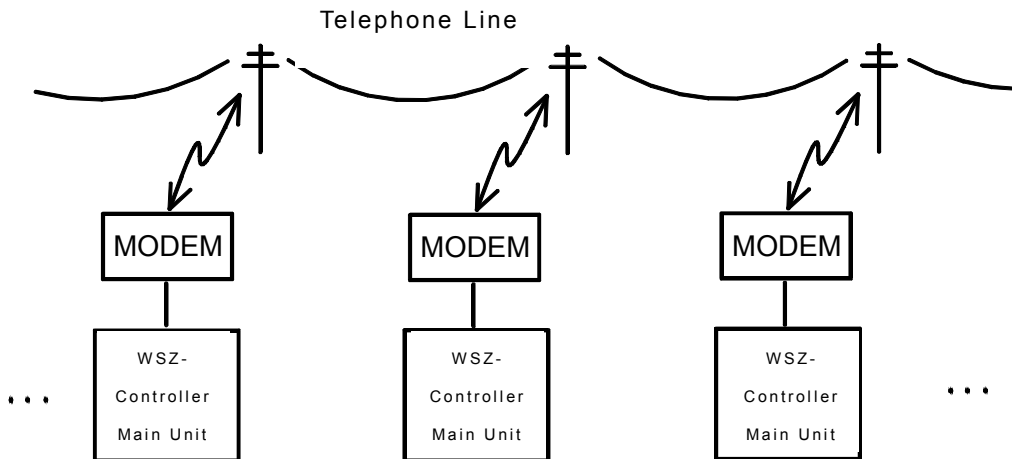

## 2.2 Formation of Multi-Unit System

By connections through communication ports and specific communication drivers, multiple Single-Unit Controller systems can be integrated to achieve resources sharing among multiple Controller or Controllers and its host computer. It is described as follows:

### 2.2.1 Connection of Multiple WSZ-Controller (CPU Link)

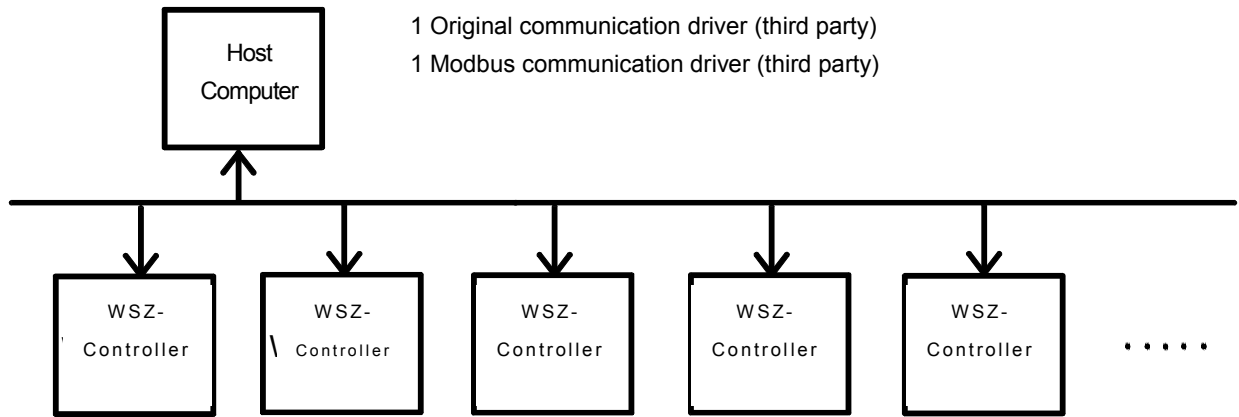

As shown in the figure, through the usage of high-speed RS-485 network, can easily establish the connections of 2~254 main units (each Controller with its own station number). All need to do is to write and execute CPU Link commands in one of the main units, which makes it the Master of the CPU Link network. No other command is necessary for other Slave units. The Master CPU will automatically collect the information or data in the specific areas of all units (including the Master) and put it into the Common Data areas (CDM) of all units. Thus all the units connected by network can share the data for each other and turning the finite Single-Unit system with limited I/O into a huge system.

Besides the above area network connection, WSZ-Controller can also be connected using MODEM via the phone line (either leased line or public phone line) to form remote multiple Controller Link. (When using a public phone line, the Master Controller will perform consecutive dialing for all its Slave Controller.)

### 2.2.2 Connection WSZ-Controller with Host Computer or Intelligent Peripherals

Any one of the two communication ports on WSZ-Controller can be used to connect to an upper-level computer or other systems, with this architecture, the WSZ-Controller is playing the Slave role. WSZ-Controller supports the Original and Modbus protocol. Connection can be established as long as the upper-level computer or intelligent peripherals use either one of the two protocols. The following is the block diagram.

# Chapter 3 Expansion of WSZ-Controller

If the I/O point of WSZ Main unit is not enough for a specific application, it can be expanded with the additional expansion unit/modules. Besides I/O point there also have the requirements to expand the communication port in some occasions.

## 3.1 I/O Expansion

The expansion of WSZ-controller I/O consists of Digital I/O (DI/O, which status is represented by a single bit) and the Numeric I/O (NI/O, which status is represented by a 16-bit Word). Either the DI/O or the NI/O expansion is realized through expansion units or modules cascaded thru the usage of the "I/O Output Expansion Connector" located at the right side of WSZ main unit or expansion unit/module.

The I/O points of WSZ controller system are limited to 512 points of DI/O (256 points for DI and DO, respectively), 128 words of NI/O (64 words for NI and NO, respectively). Besides this there are two limits imposed by hardware: ① A maximum number of 32 units or modules can be used in the expansion. ② The total length of the expansion cables cannot exceed 5 meters.

### Caution

1. If the DI or DO points of the application system exceed 256 points, while startup the main unit of WSZ controller will treat this as an illegal I/O configuration, which in return will flag as an error situation by turn on the "ERR" LED and put the error code in Y0~Y3 LED (refer the page H8-2, Chapter 8). The corresponding error code will also be indicated in the CPU status register (R4049).
2. If the NI or NO points of the application system exceed 64 points, while startup the main unit of WSZ controller will treat this as an illegal I/O configuration, which in return will flag as an error situation by turn on the "ERR" LED and put the error code in Y0~Y3 LED (refer the page H8-2, Chapter 8). The corresponding error code will also be indicated in the CPU status register (R4049).
3. The maximum number of expansion unit/modules of WSZ controller is 32. Beyond this numbers will be treated as an invalid I/O configuration and the main unit will stop its operation, which in return will flag as an error situation by turn on the "ERR" LED and put the error code in Y0~Y3 LED (refer the page H8-2, Chapter 8). The corresponding error code will also be indicated in the CPU status register (R4049).

### Warning

1. The maximum length of the I/O expansion cable for WSZ controller is 5 meters. Cables longer than that will cause incorrect I/O operation because of excess signal delay in hardware or noise pickup, resulting in damage to equipment or posing hazard to operating personnel. Since this kind of situation cannot be detected by the main unit, users are advised to take extra cautions and necessary measures.

### 3.1.1 Digital I/O Expansion and I/O Numbering

Digital I/O means I/O with the discrete type status, including digital input (with initial X in DI numbering) and digital output (with initial with Y in DO numbering). The DI and DO of WSZ controller can both be expanded up to 256 points (numbered as X0~X255 and Y0~Y255, each with 256 points).

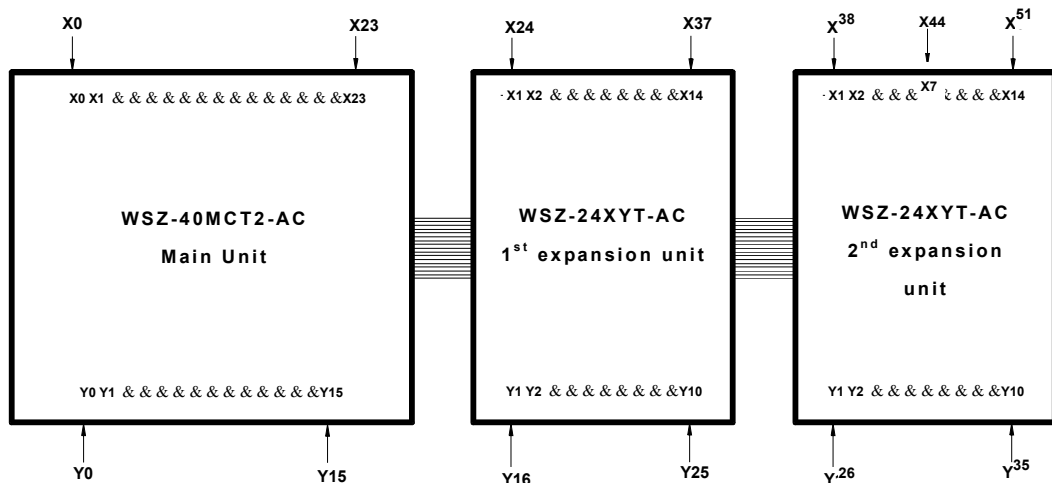

The status of input contacts (X0~X255) of controller come from the input signal connected to the digital input terminal block on main unit or expansion unit/module; while the status appears at digital output terminal block of main unit and expansion unit/module reflects the digital output relay (Y0~Y255) status inside controller.

On main unit, at the position below the digital input terminal block and the position above the output terminal block, there have labels indicate the corresponding signal name. They label each terminal with numbers representing the corresponding digital input contact Xn and digital output relay Yn. In the example of the main unit in WSZ-24MCT2-AC the corresponding digital input contacts on the input terminal block are labeled X0~X13, and the corresponding digital

output relays on the output terminal block Y0~Y9. Users only need to locate the printed label for each terminal to find out its I/O number. The LED status display region also indicates the ON/OFF status for all DI (X0~X13) and DO (Y0~Y9) on the main unit. Users can easily find each terminal with its I/O number and LED status indication, as shown in the figure below using X10 and Y6 as an example:

While the various expansion unit/modules other than the main units have the same printed labels on the input/output terminals as the main units do, these labels are only relative I/O numbers, different from the absolute I/O numbers on main units. The number of a terminal only represents its order on the expansion unit/module. For example, the first contact is X1 or Y1, the second X2 or Y2, etc. All numbers on the expansion unit/module begin with 1. The actual number of digital input contact or the output relay, however, is determined by summing the numbers on all previous expansion units/modules and the main unit. See the following figure and its calculation.

As shown in the above figure, because the top X numbers of the previous two units are 23 and 14, respectively, the number of input contact X12 on second expansion unit should be:

$$X (23 + 14 + 12) = X49$$

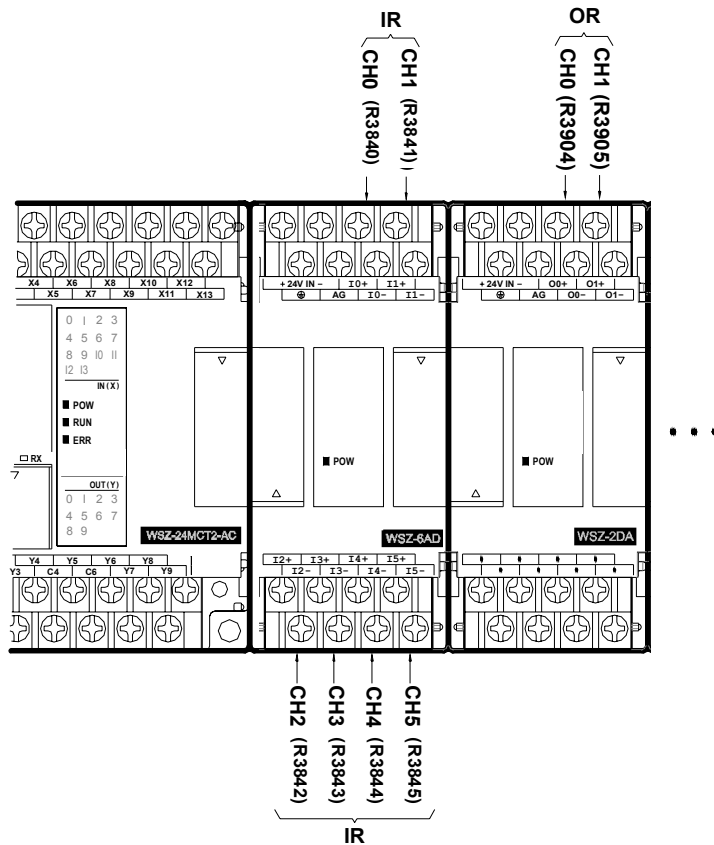

### 3.1.2 Numeric I/O Expansion and I/O Channel Mapping

The numeric I/O in WSZ-controller treat 16 single-bit data as one 16-bit numeric data (Word) ranging from the 0~65535. Since all numeric data of WSZ controller are stored in the register inside controller (16-bit width), therefore numeric I/O is also called register I/O. The Input Register (IR) has 64 Word (R3840~R3903) for inputs from external numeric input (NI) module, and the Output Register (OR) also has 64 Word (R3904~R3967) for outputs to external numeric output (NO) module.

Analog Input Module is of Numeric input (NI) modules which use input register (IR) to convey the status. Analog Output Module is of Numeric output (NO) modules which output are directly from the Output register (OR). The Analog Input and Analog Output are of analog voltage or current. Either the magnitude of voltage or current is represented by the 16-bit value of the corresponding register. The corresponding current/voltage signal of any IR or OR on the NI/O module is named as a Channel (CH). The channels on the NI module are called numeric input channels (NI channels) and those on NO module numeric output channels (NO channels). The number of IR/OR used by NI and NO channels on each module varies depending on the module type or working mode. The following table lists the numbers of IR and OR used by NI and NO channels on each NI/O module:

NI/O Module Name	NI Channel Label	NO Channel Label	Number of IR occupied (Word)	Number of OR occupied (Word)	Note
WSZ-6AD	CH0		1		
	CH1		1		
	CH2		1		
	CH3		1		
	CH4		1		
	CH5		1		
WSZ-2DA		CH0		1	
		CH1		1	

The corresponding IR or OR number calculation of the NI/O module starts from the first expansion unit/module (main unit itself does not have any NI/O). The first NI channel corresponds to the first IR register (R3840). Adding the IR number of the second NI channel with the number of IR used by the second NI channel gives the IR number of the third NI channel. All other numbers can be obtained accordingly. Similarly, the first NO channel corresponds to the first OR (R3904). Adding R3904 with the number of OR used by the first NO channel gives the OR number of the second NO channel. (In the cumulative calculation of NI channels, care only for NI channels and disregard DI/O and NO. Similarly, in the case of NO channels, disregard DI/O and NI channels.) The following figure helps users find out the relation between NI/O channels and controller's IR and OR.

During the startup stage, WSZ controller will automatically detect the types and CH numbers of expansion units. While operation, the WSZ controller will read the CH input values from the NI module and stores them into corresponding IR (R3840~R3903) and outputs OR values (R3904~R3967) to channels on the NO module. No pre-configuration or setting by users is required.

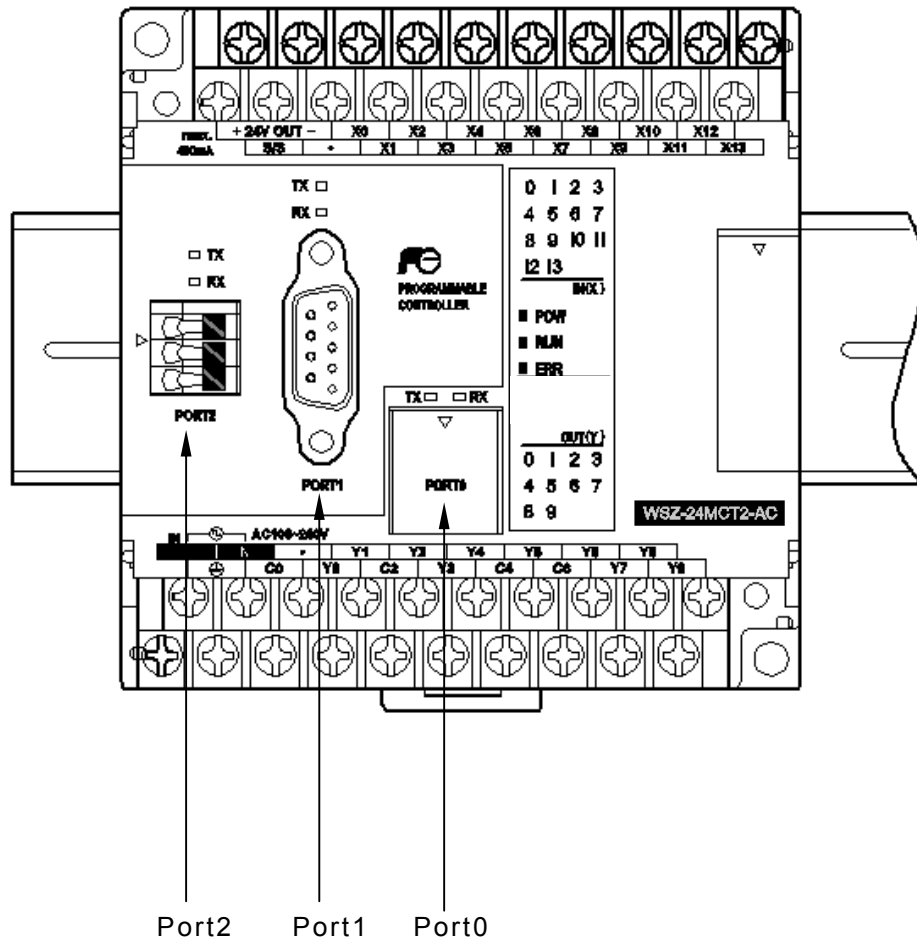

### 3.2 Expansion of Communication Port

The main unit has one build-in communication port (port 0, with RS232 interface). Expansion of communication ports can be achieved by employing Communication Board (CB). The available model of CB for WSZ is:

	Model Number	Specifications
Communication Board (CB)	WSZ-CB25	1 RS232 (port1) + 1 RS485 (port2) communication board

Communication board, which can be directly installed on main units, is employed for expansion of communication ports port1 and port2. The labels of communication ports are marked on the cover plate of communication board, from which users can easily identify each port. Except that the build-in communication port (Port 0) can only be used for RS232 interface, all the other ports (Port1~2) can be used for RS232 or RS485 interface in CB. The following figure shows an example of expansion of 3 (maximum allowed number) communication ports (CB25):

The most expansion of communication port diagram

# Chapter 4 Installation Guide

## ⚠ Danger

1. Turn off all power during installation of WSZ controller or related equipments to prevent electric shock or damage to equipment.
2. Upon completion of all installation wiring, put the protective cover back on the terminal block before turning on the power to avoid electrical shock.
3. During installation, never remove the dust cover sheet that were surrounded the controller before wiring is completed to avoid complications such as fire hazards, breakdown, or malfunction caused by drill dust or wire shreds falling inside controller.
4. Upon completion of installation and wiring, remember to remove the dust cover sheet to avoid fire, breakdown or malfunction, caused by overheating.

### 4.1 Installation Environment

## ⚠ Caution

1. Environmental specifications of WSZ controller cannot exceed those listed in this manual. In addition, do not operate this equipment in environments with oil smoke, conductive dust, high temperatures, high humidity, corrosion gases, inflammable gases, rain or condensation, and high vibrations and shock.
2. This product has to be housed appropriately whether it's used in a system or standalone. The choice and installation of housing must comply with local national standards.

### 4.2 Precautions of Controller Installation

To avoid interference, the controller should be installed to keep from noise sources such as high-voltage or high-current lines and high power switches. Other precautions are:

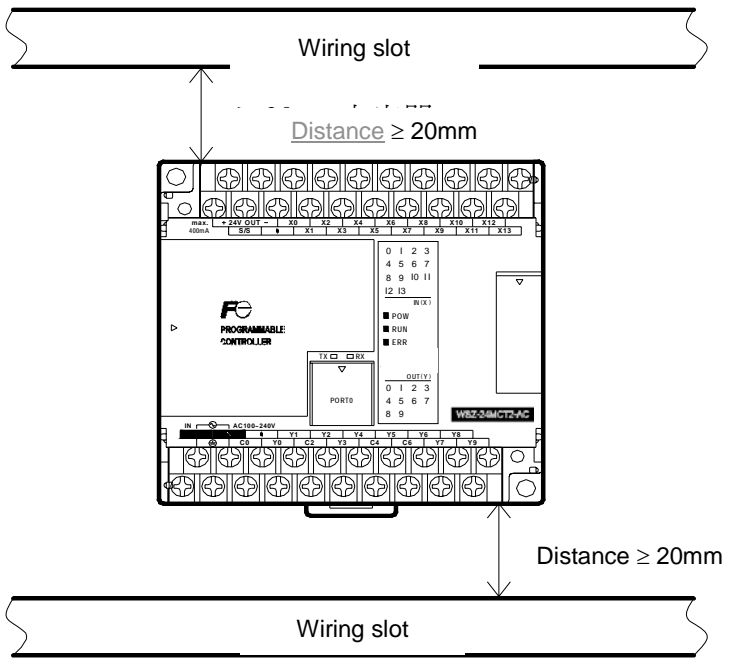

#### 4.2.1 Placement of Controller

Fixation of WSZ controller, which can be fixed by DIN RAIL or screws, should place vertically and start from the main unit on the left to the expansion unit on the right. A typical figure of placement is shown below:

### 4.2.2 Ventilation Space

The heat in WSZ controller is ventilated via air circulation. There should reserve more than 20mm space, both below and above controller, and with vertical installation, for ventilation. As shown in the figure below:

### 4.3 Fixation by DIN RAIL

In an environment with slight vibration (less than 0.5G), this is the most convenient way of fixation and is easy for maintenance. Please use DIN EN50022 DIN RAIL, as shown in the figure below.

**Mount** ⇒ Hold controller facing its front, press it down with a 15 degree tilt onto the DIN RAIL. Swing it down until the upper edge of DIN RAIL groove on controller back touches the upper tab of DIN RAIL. Then use this locked-in point as a pivot to press the controller forward on the bottom and lock it in position. The procedure is illustrated below:

**Dismount** ⇒ Use a long screwdriver to reach in the hole on the DIN RAIL tab. Pull out the tab to "pulled out" position to remove controller, as shown in the figure below.

## 4.4 Fixation by Screws

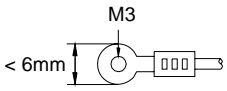

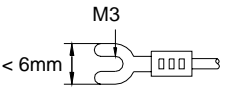

In environments with larger vibration (more than 0.5G), the unit must be secured by M3 or M4 screws. Positions and sizes of screw holes in various models of WSZ controller are illustrated in the following:

#### 4.5 Precautions on Construction and Wiring

1. During the wiring of WSZ controller, please follow local national standards or regulations for installation.
2. WSZ-Controller's I/O wiring restricts the use of AWG24~AWG12 copper wire, please note that I/O wiring to be in accordance with the current load and select the appropriate wire diameter of the wiring.
3. Shorter wires are preferred. It is advised that the length of I/O wiring does not exceed 100m (10m for high-speed input).
4. Input wiring should be separated from output or power wiring (at least 30~50mm apart). In case separation is not possible, adopt vertical crossing, no parallel wiring is allow.
5. The pitch of WSZ controller terminal block is 7.62mm. The torque for screw and suggested terminal is shown below:

7.62 mm terminal block	 	torque: 6~8kg-cm
---------------------------	--	------------------

# Chapter 5 Power Supply Wiring, Power Consumption Calculation, and Power Sequence Requirements

WSZ controller internally has three kinds of circuit: a 5VDC logic circuit, a 24VDC output circuit, and a 24VDC input circuit. They are all powered by the built-in power supply of main/expansion units. Expansion modules other than main/expansion units do not contain any power supply and are powered by the power supply inside the main/expansion units.

 <b>Caution</b>
In industrial environments, main power may irregularly experience a surge current or high voltage pulse caused by the start or shut down of high power equipment. Users are advised to take necessary measures (for example, the use of isolation transformer or other MOV suppression devices) for the protection of controller and its peripherals.

## 5.1 Specifications of AC Power Sourced Power Supply and Wiring

The available AC power supplies of WSZ controller are the 24 Watt (SPW24-AC) supply for 20~60PTs main/expansion unit. SPW24-AC is to be installed on a main unit or inside an expansion unit, where their appearances are invisible. The following table lists the specifications:

Spec Item	Model	SPW24-AC
Input Range	Voltage	100 ~ 240VAC -15% / +10%
	Frequency	50 / 60HZ -5% / +5%
Max. Power Consumption		36W / 24W
Inrush Current		20A@264VAC
Allowable Power Interrupt		< 20ms(min.)
Fuse Spec.		2A , 250VAC
Isolation Type		Transformer/Photo-coupler Isolation, 1500VAC/minute
Power*1 Output	5VDC(logic circuit)	5V , ±5% , 1A(max)
	24VDC(output circuit)	24V , ±10% , 400mA(max)
	24VDC(input circuit)	24V , ±10% , 400mA(max)

Note \*1 : The 5VDC (for logic circuit) output power and the 24VDC (for output circuit) power can be accessed from the "I/O expansion output header" located on the right side of the main/expansion units for expansion modules. And the 5VDC power is also used by communication board (CB25). The 24VDC power for input circuits is provided from the farthest 2 upper left terminals (labeled "+24V OUT-") on the input terminal block of main/expansion unit to input circuit in expansion module or other sensors.

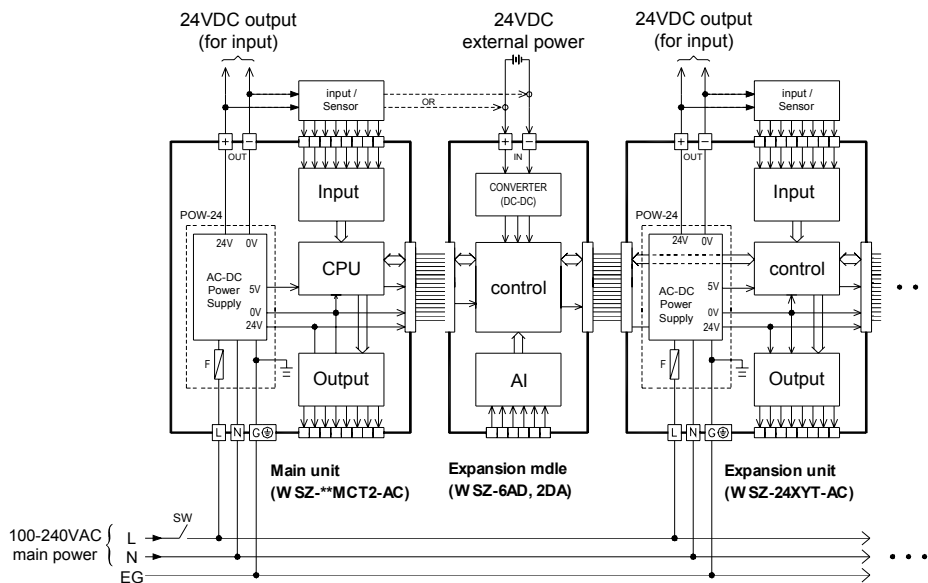

## ⚠ Caution

The schematic diagram of AC power supply wiring in main/expansion units is shown below. Also be cautious about the following:

1. Please follow the wiring schemes regulated by local national standards to use single-pole switch (break hot wire "L"), or double-pole switch (break both "L" and "N"), to turn on or off the AC input power.
2. In wiring, hot wire "L" must be connected to the L terminal on unit, while the ground line "N" connected to the N terminal. Please use wires with diameters  $1\text{mm}^2 \sim 2\text{mm}^2$ .
3. All G terminals on main unit and expansion unit/module have to be connected to the EG (Earth Ground) terminal of main power system as shown in the figure below, with wire diameters larger than  $2\text{mm}^2$ .

## ⚠ Warning

Output of power for sensor cannot be connected in parallel with other powers, in which the conflict between two sets of power will decrease their lifetime or cause immediate damage. This will induce unexpected malfunction of controller and cause serious or even deadly damage to people or equipment.

## 5.2 Residual Capacity of Main/Expansion Unit & Current Consumption of Expansion Module

Besides its own circuit usage, the residual capacities of three sets of built-in power supply of main/expansion unit are big enough for other expansion modules usage. As each model of the main/expansion unit has different residual capacity, various models of expansion modules also consume different amounts of current. In practice, one has to consider the match between the two to avoid overload in any of the three sets of output power. In the following, the worst case of the available residual capacity in each main/expansion unit and the maximum power consumption of expansion modules are described below spare.

### 5.2.1 Residual Capacity of Main/Expansion Unit

Model		Extra Capacity	Output Power		
			5VDC(logic circuit)	24VDC(output circuit)	24VDC(input circuit)
Main Unit	WSZ-24MCT2-AC		722 mA	325mA	295mA
	WSZ-32MCT2-AC		712 mA	315mA	262mA
	WSZ-40MCT2-AC		688 mA	295mA	244mA
	WSZ-60MCT2-AC		644 mA	255mA	190mA
Expansion Unit	WSZ-24XYT-AC		948 mA	337mA	337mA

- In the above table, the residual capacity is calculated according to the most power-consuming model of in each main/expansion unit by its I/O point number, under the maximum load condition (with both DI and DO ON). The basic units for calculation are 7.5mA /PT for high/medium speed DI, 4.5mA/PT for low speed DI, 10mA/PT for high speed DO, 7.5mA/PT for medium speed DO, and 5mA for low speed DO.

### Warning

Either for the built-in power supply of the main/expansion unit or the expansion power supply for the expansion unit, the total amount of current cannot exceed the value listed in the above table. Any violation will cause a voltage drop by overloading the power supply, or intermittent powered with the supply in protection mode, either of which will result in unexpected action of controller and cause harm to people or damage to equipment.

### 5.2.2 Maximum Current Consumption of Expansion Module

Without its own power supply, expansion modules must be supported by the main/expansion unit, expansion power, or external power supply (24VDC input circuit alone). The following table lists the maximum consumption current of each expansion module.

Model		Current	5VDC Logic Circuit	24VDC Output Circuit	24VDC Input Circuit
Expansion Module	WSZ-6AD		25 mA	—	53 mA
	WSZ-2DA		33 mA	—	90 mA
	WSZ-4A2D		25mA	—	80mA
	WSZ-16YR		39mA	80mA	—
	WSZ-16TC		33mA	—	30mA
Communication Board (CB)	WSZ-CB25		55 mA	—	—

- The above table lists the required current for the maximum consumption in each expansion module. The 24VDC input circuit consumes 4.5mA less per point of OFF state DI in DI/O module. The effects of power consumption variation regarding the ON/OFF state of DI/DO of expansion modules other than DI/DO are less significant and can be neglected.

- The effect of residual capacity variation regarding the ON/OFF state of DI/DO for 5VDC logic circuit can be neglected.

### 5.3 Requirement of Power Sequence in Main Unit & Expansion Unit/Module

When the power is on, the main unit first detects the type and number of expansion unit/module attached to its expansion interface and get the actual I/O configuration. Therefore, while the main unit performs detection, the power in expansion unit/module should be already UP, otherwise, the detected I/O configuration will not correct. Namely, the power of expansion unit/module should be ON simultaneously or even earlier. There will be no time sequence error when main unit/expansion unit/module is connected together to one power. If the expansion unit and main unit powered by different powers (or the same power but different switches), or external power supply is used for expansion modules, time sequence of both powers should be considered. To solve the problem of the expansion unit/module power not get ready before main unit power does, WSZ controller provides a special R4150 register which can delay the detection time of I/O configuration. The time base of R4150 is 0.01sec with a default value of 100 (namely a 1sec delay), which can be set from 100~500 (1~5sec), as shown in the figure below. If the expansion unit power cannot be UP within 1sec after main unit power is ON, the R4150 time needs to be set longer to delay the detection by CPU. It cannot exceed 5sec; however, otherwise the configuration of expansion interface cannot be detected.

# Chapter 6 Digital Input (DI) Circuit

The WSZ controller provides the single-end 24VDC inputs which use the common terminal to save terminals. The response speeds of single-end input circuits are available in high, medium and low. The single-end input circuit is set to SINK or SOURCE (we will use the term SRCE) by the wiring of the common terminals S/S inside controller and external common wire of input circuits (see Sec. 6.2 for details).

## 6.1 Specifications of Digital Input (DI) Circuit

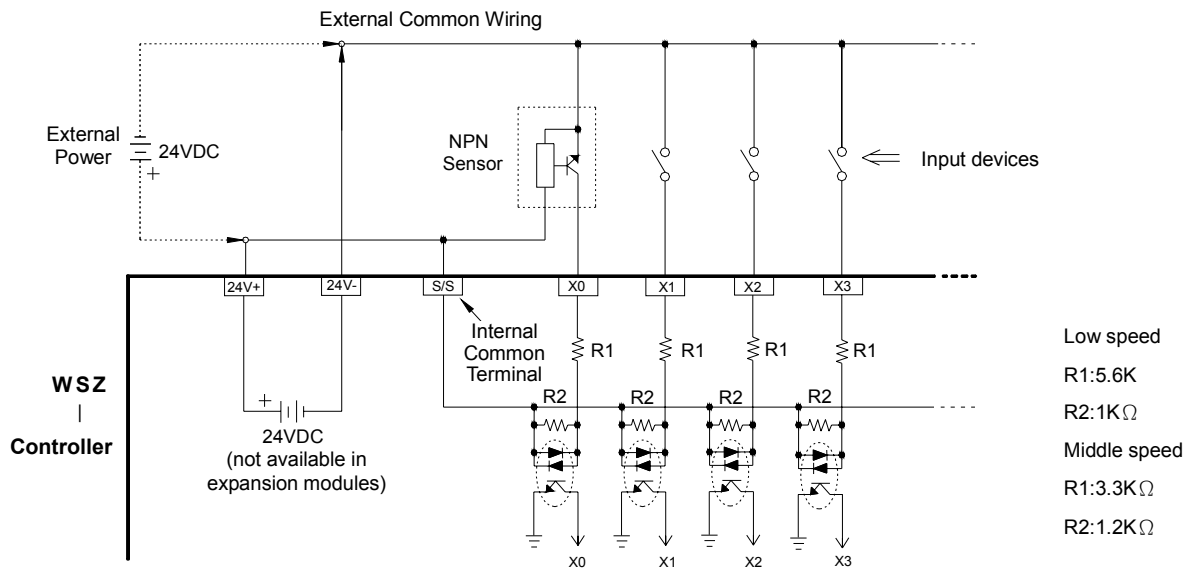

Item		24VDC Single-end Input					Note	
		High Speed (HSC)	Medium Speed (HSC)		Medium Low Speed (Capture input)	Low Speed		
Specifications								
Maximum input frequency Accumulated time		200kHz	20kHz (HHSC)	Total 5kHz (SHSC)	0.47ms	4.7ms	Half of maximum frequency while A/B phase input	
Input Signal Voltage		24VDC±10%						
Input Current Threshold	ON Current	> 8mA	> 4mA		> 2.3mA			
	OFF Current	< 2mA	< 1.5mA		< 0.9mA			
Maximum Input current		10.5mA	7.6mA		4.5mA			
Input Status Indication		Displayed by LED: Lit when "ON", dark when "OFF"						
Isolation Type		Photo-coupler signal isolation, 500VAC, 1 minute						
SINK/SRCE Wiring		Via variation of internal common terminal S/S and external common wiring						
List of Input Response Speed for Various Models	WSZ-24MCT2-AC	X0,1,4,5	X8,9,12,13	X2,3,6,7,10,11	-	-		
	WSZ-32MCT2-AC	X0,1,4,5,8,9	X12,13	X2,3,6,7,10,11,14,15	X16~19	-		
	WSZ-40MCT2-AC	X0,1,4,5,8,9	X12,13	X2,3,6,7,10,11,14,15	X16~23	-		
	WSZ-60MCT2-AC	X0,1,4,5,8,9,12,13	-	X2,3,6,7,10,11,14,15	X16~35	-		
	Expansion Unit	-	-	-	-	All Input Points		
Noise Filtering Time Constant		DHF(0ms ~ 15ms) + AHF(0.47μ s)	DHF(0ms ~ 15ms) + AHF(4.7μ s)	DHF(1ms ~ 15ms) + AHF(0.47ms)	AHF(4.7ms)			DHF : Digital Hardware Filter AHF : Analog Hardware Filter

HSC: High Speed Counter  
 HHSC: Hardware High Speed Counter  
 SHSC: Software High Speed Counter

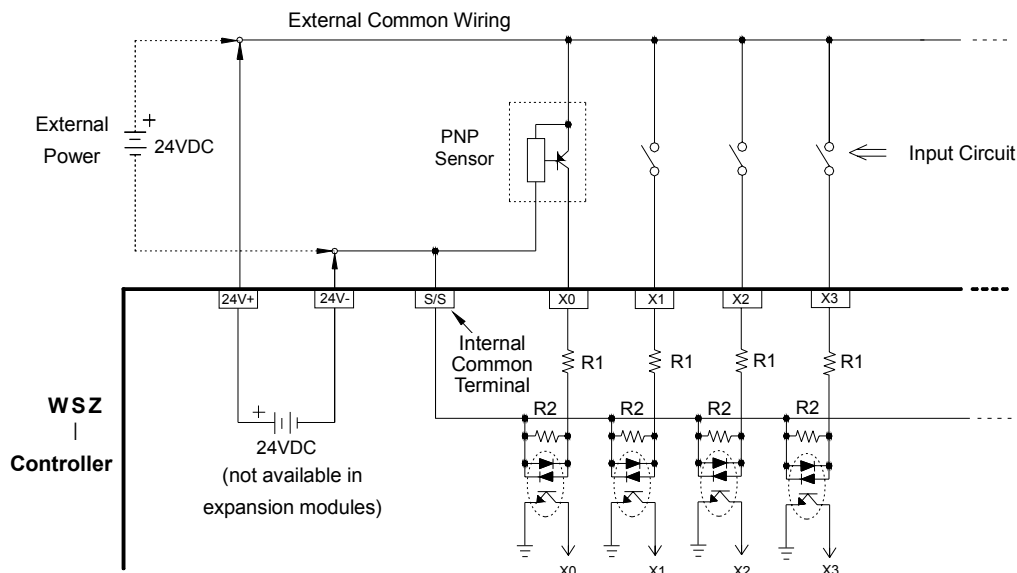

## 6.2 24VDC Single-End Input Circuit and Wiring for SINK/SRCE Input

The 24VDC single-end digital input circuits are available for high, medium and low speed. They all have the similar circuit structures but with different response speeds. To save input terminals, the circuit of single-end input is implemented by connecting one end of all input points (photo-coupler) inside the controller to the same internal common point labeled as S/S. The other end of each input circuit is connected to corresponding terminals such as X0, X1, X2, etc. The S/S common terminal and N single-end inputs comprise of N digital inputs (i.e., only N+1 terminals are used for N terminals). Therefore, we call this type of input structure the single-end input. The user also needs to do the same thing when making the connection of external digital input devices. Namely, the one end of all input devices (e.g., buttons, switches) are connected together and called the external common wire, while the other ends of input circuits are connected to the input terminals X0, X1, X2, etc., of controller. Then finish it by connecting the external common wiring and internal common terminal S/S to the positive/negative terminals of the 24VDC power. When connect the internal common terminal S/S to 24V+(positive) and the external common wire to 24V- (negative), then the circuit serve as SINK input. On the contrary, while exchange the wiring of the above internal and external common will serve as a SRCE input. The above wiring schemes can illustrated below:

- Wiring of single-end common SINK input (internal common terminal S/S → 24V+, external common wiring → 24V-)

- Wiring of single-end common SRCE input (internal common terminal S/S → 24V-, external common wiring → 24V+)

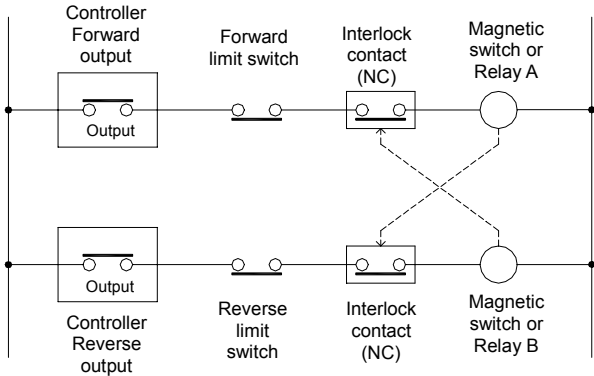

# Chapter 7 Digital Output (DO) Circuit

The digital outputs of WSZ-controller are available in the single-end output circuit for saving terminal. There are two kinds of output device for the single-end output, which are relays and transistors. Since the relay is bilateral, even when used in single-end output, it can serve as SINK or SOURCE output. The transistor, however, because of its polarities, is needed to be careful about connection with the power (common point Cn of SINK output must connect to negative end of DC power).

 **Warning**

1. No over current protection is available in the WSZ series controller. All other output circuits have to be added with over current or short circuit protections externally, such as fuses, in applications with safety concern.
2. Terminals labeled by “●” on the terminal block are empty contacts, which cannot be connected with any wire to maintain the required safety clearance and to avoid damage to the unit.
3. In situations where simultaneous operations of outputs(such as reverse/forward action of motor) pose safety concerns, besides the interlock in controller programs, additional interlock circuits are needed outside controller, as shown below :

## 7.1 Specifications of Digital Output Circuit

Item		Single-End Transistor Output			Single-End Relay Output
		High Speed	Medium Speed	Low Speed	
Specification					
Maximum switching (working) Frequency*		200KHz	20KHz	On/Off	For On/Off, not for frequent exchange
Working Voltage		5~30VDC			<250VAC,30VDC
Maximum Load Current	Resistive	0.5A		0.5A/ 0.1A (24XYT)	2A/single, 4A/common
	Inductive				80VA(AC)/24VA(DC)
Maximum Voltage Drop (@ maximum load)		0.6V	2.2V		0.06V(initial)
Maximum load		-			2mA/DC power
Leakage Current		< 0.1 mA/30VDC			-
Maximum Output Delay Time	ON→ OFF	2μ s	15μ s		10ms
	OFF→ ON		30μ s		
Output Status Indication		LED is bit when "ON" , dark when "OFF"			
Over Current Protection		N/A			
Isolation Type		Photo-coupler Isolation, 500VAC, 1 minute			Electromagnetic Isolation, 1500VAC, 1 minute
Output Type		Transistor (SINK)			Bilateral device, can be arbitrarily set to SINK/SOURCE output
For Various Models Response Speed List of output	WSZ-24MCT2-AC	Y0~3	Y4~7	Y8, 9	-
	WSZ-32MCT2-AC	Y0~5	Y6, 7	Y8~11	-
	WSZ-40MCT2-AC	Y0~5	Y6, 7	Y8~15	-
	WSZ-60MCT2-AC	Y0~7	-	Y8~23	-
	Expansion Units/Modules	-	-	All output points	All output points

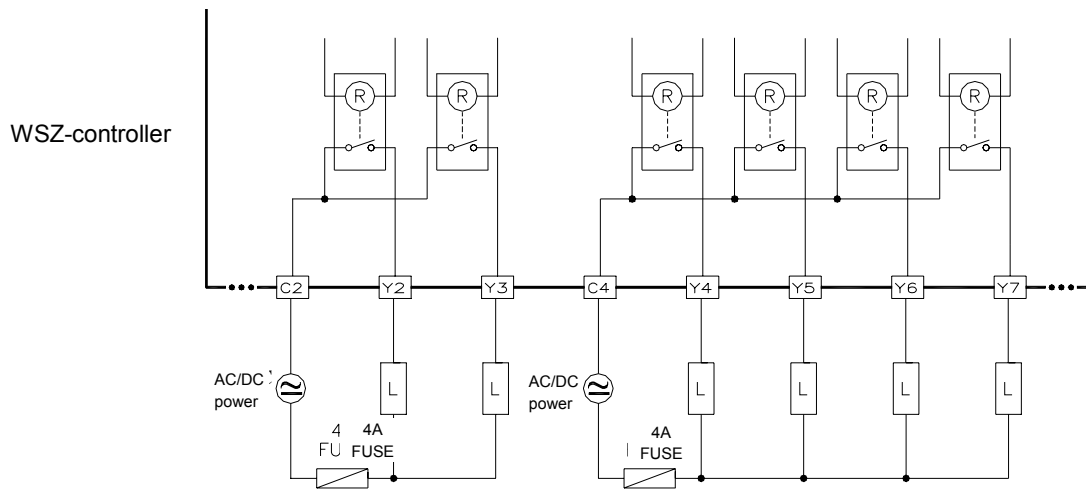

Note\* : Half of the maximum frequency while A/B phase output

## 7.2 Single-End Output Circuit

Transistor output circuit is single-end output structure. A single-end output in each digital output (DO) takes up only one terminal. But since any output device has two ends, the one end of several output devices have to be connected together to one common point (called output common) for single-end output. Then each output point can output via this common point. The more output device share a same common points, the more terminals are saved, while relatively increasing the current running through the common point. Combination of any output common with its individual single-end outputs are called a Common Output Block, which is available in 2, 4 and 8PTs (high-density module) in WSZ controller. Each Common Output Block is separated from one another. The common terminal has a label initiated with letter "C", while its numbering is determined by the minimum Yn number which comprises the output block. In the example of the figure below, the number of common terminal of output block Y2 and Y3 is C2, while the number of common terminal of output Block Y4, Y5, Y6 and Y7 is C4. The various single-end common output circuits are described below :

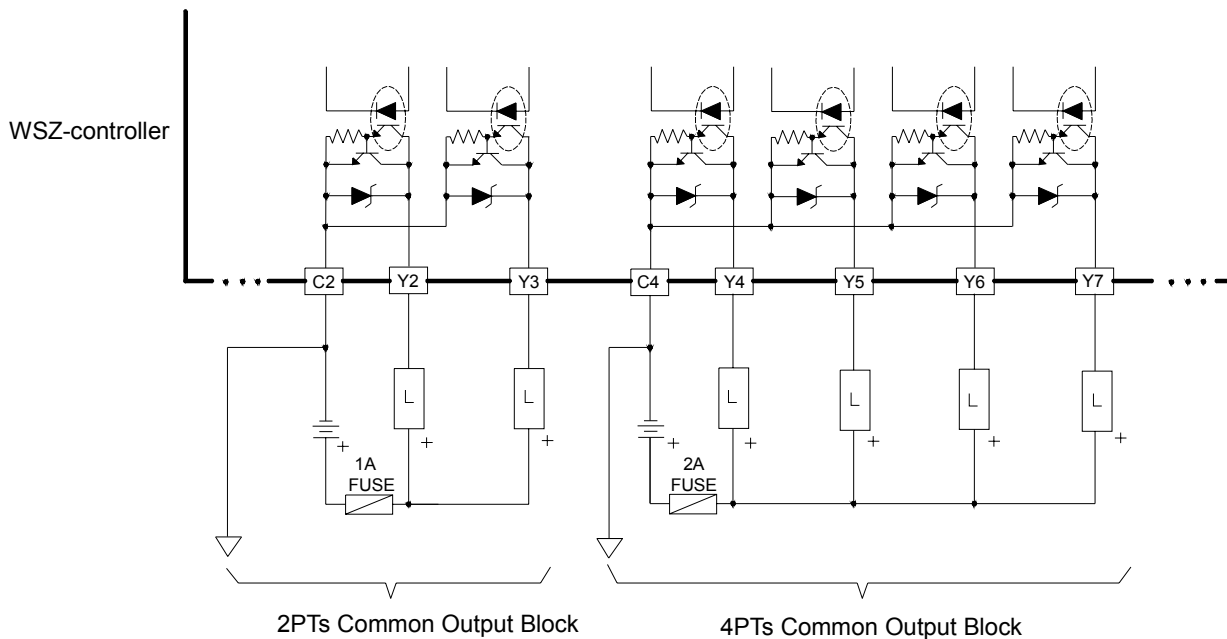

### 7.2.1 Structure and Wiring of Single-End Relay Output Circuit

Because relay contacts have no polarity, it can be applied for AC or DC load power. Each relay can provide current up to 2A. The maximum rated current in all output commons of FBS-PLC is 4A. Its mechanical lifetime can reach up to 2 million times, while the contacts have a shorter lifetime. The lifetime also varies depending on working voltage, load type (power factor  $\cos \phi$ ) and contact current. The relation between them is plotted in the figure below. In the case of pure resistive load ( $\cos \phi = 1.0$ ) at 120VAC and 2A, the lifetime of contacts is about 250 thousand times. While for high inductive or capacitive load with  $\cos \phi$  up to 0.2 and current within 1A, the lifetime decreases rapidly to about 50 thousand times (AC200V) or 80 thousand times (AC120V).

## 7.2.2 Structure and Wiring of Single-End Transistor SINK Output Circuit

### A. Transistor Single-End SINK Output

The figure above uses output blocks of 2PTs common and 4PTs common as an example to explain the differences in structural and wiring for SINK output circuits, respectively. (8PTs common has the same block structure and wiring, except with different point number)

## 7.3 Speed Up the Single-End Transistor Output Circuit

With the SINK structure in single-end output transistor circuit, when the transistor switches from ON to OFF, the junction capacitor between transistor CE electrodes should be charged to near the load voltage VDD before it can stop the current running through the photo-coupler inside the load, which increases the OFF time and decreases the response speed. This problem can be solved by adding a Dummy load to accelerate charging rate and speed up the working frequency of transistor output. For the transistor output, Dummy load that are added to the high- and medium-speed transistor output and generate a load current of 20~50mA is adequate. For low speed transistor where its driving capability (0.5A) but speed is concerned, adding a Dummy load only decreases its driving capability without any significant improvement and hence is not recommended. The following diagram shows how to add a Dummy load to SINK transistor output.

## 7.4 Output Device Protection and Noise Suppression in DO Circuit

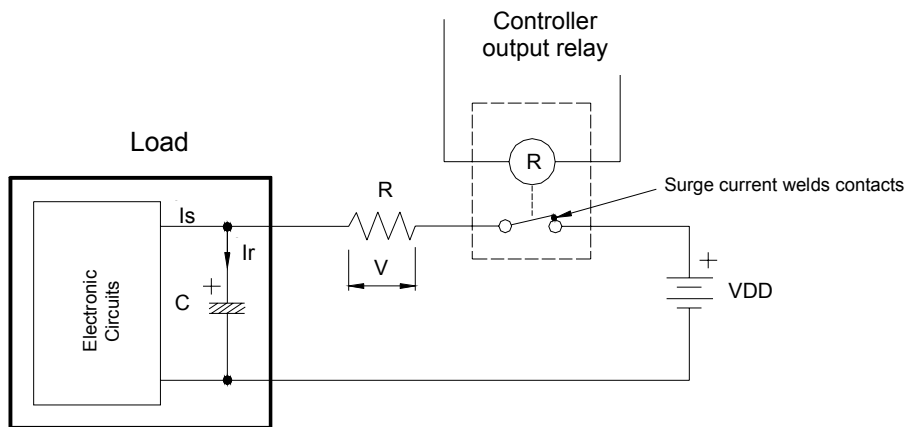

Since the digital output circuit is mainly used for the ON/OFF switching operation, the output components such as transistors can be deemed as kinds of switch components. Normally, counter-electromotive force voltages are generated during the ON/OFF operation of these switch components. The effect of surge counter-electromotive force voltages is particularly serious when heavy capacitive or inductive loads are incorporated, which may cause damage to the output components or generate noises in other electronic circuits and equipment. Special consideration should be given to transistors when they are used in high power applications or connected with capacitive or inductive loads and are described in the following:

### 7.4.1 Protection of Relay Output and Noise Suppression

Because the relay contacts are used to contact switch components having extremely low resistance, the surge current  $I_R$  generated instantly upon turning on the relay is normally pretty strong (even if the steady load current is very small). Under such strong surge, the contact tends to melt and stick due to extreme temperature in such a way that the relay cannot trip when it is disconnected. In addition, when the relay connections are OFF, large  $di/dt$  is generated because of the instantaneous change from low resistance to open circuit ( $\infty$ ) soon after following the tripping of contact. As a result, an extremely strong counter-electromotive force voltage is induced, which creates sparks between the electrodes of two relay contacts and results in poor contact due to carbon deposits. Among those three output components, either in ON or OFF state, very serious interference can be caused by the surge current or the counter-electromotive force of the relay. The solutions to this problem are listed as follows:

#### A. Suppression of Surge Current

Connect a small resistor  $R$  in series to lower the surge current, but note that too large  $R$  will affect the driving capability or cause too much voltage drop.

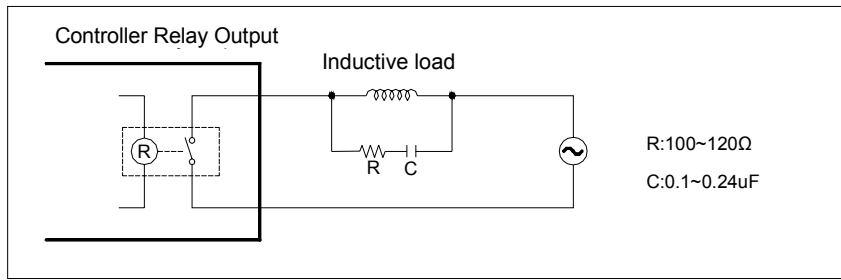

$$R \geq \frac{VDD}{I_r \text{ max}} \quad (\text{note power dissipation } P=I_s^2R \text{ and voltage drop } V=I_sR)$$

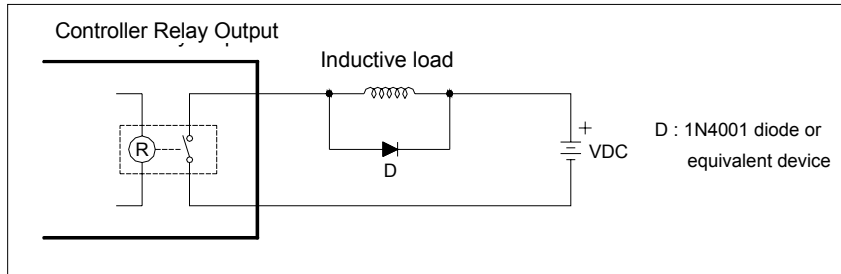

$I_r \text{ max}$  of relay in WSZ-Controller =5A

#### B. Suppression of Counter-Electromotive Force

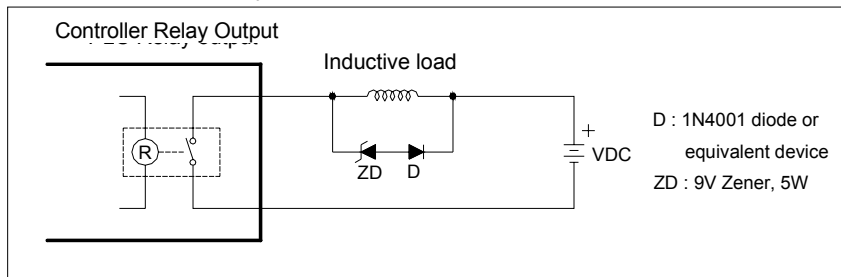

For the inductive load, whether in AC or DC power, suppression devices must be connected in parallel to both its ends to protect the relay contacts and lower noise interference. The schematic diagrams for AC and DC powers are shown below, respectively:

Scheme of AC power load

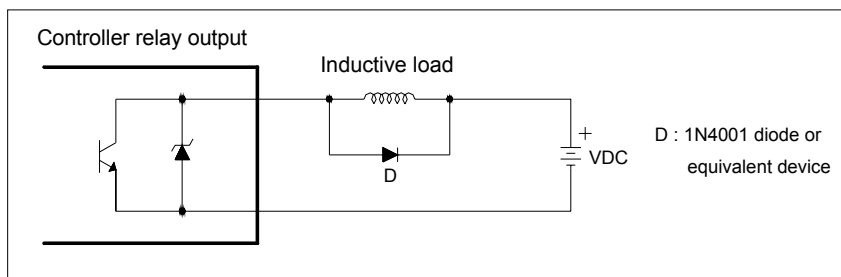

Suppress by a diode in DC power load (for low power )

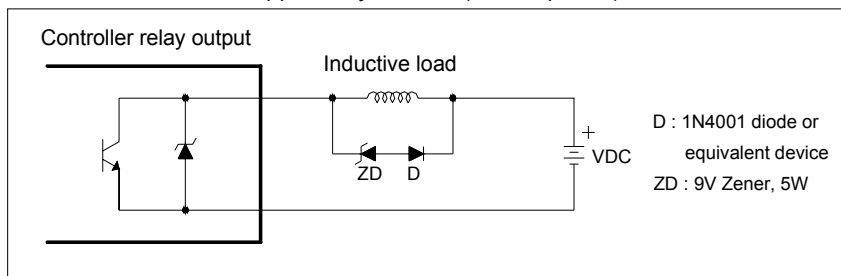

Suppress by a diode + Zener in DC power load (for high power and frequent ON/OFF)

### 7.4.2 Protection of Transistor Output and Noise Suppression

The transistor output already includes Zener diode for counter-electromotive force, which is sufficient for low power inductive load and medium frequency of ON/OFF application. In conditions of high power or frequent ON/OFF, please construct another suppression circuit to lower noise interference and prevent voltage from exceeding the limit or overheating that may damage the transistor output circuit.

Suppress by a diode (for low power)

Suppress by a diode + Zener (high power and frequent ON/OFF)

# Chapter 8 Test Run, Monitoring and Maintenance

## Warning

During maintenance, be sure to turn off the input power of controller in case the actions to touch any terminal on controller, or insert and extract accessories (e.g., expansion ribbon cables) are required. Otherwise, electric shock, short circuit, damaged controller or controller malfunction will be caused if the power is on.

### 8.1 Inspection after Wiring and before First Time Power on

1. Before power on, clean all unnecessary objects such as iron chippings and screws, and remove the dust cover sheet that surround the WSZ-controller.
2. Make sure that the input power and controller required power is of the same type. When input power is AC power, please pay attention to connect the hot wire (L) to the “L” terminal on controller and the ground wire (N) to the “N” terminal. Mistakenly connect to terminals other than “L” and “N” will result in electric shock, serious damage or malfunction.
3. Make sure the load power and controller output circuits are consistent. Connection of AC power to transistor output will damage controller or result in malfunction.
4. Make sure the 24VDC input and polarities of SINK in transistor output are consistent with those of your existing wiring. Any mismatch will result in failure of controller input and damage to the output circuit.

### 8.2 Test Run and Monitoring

The WSZ controller provides a convenient feature to Disable/Enable the I/O points by whole or individually. Namely, while controller performs the normal logic scan operation and I/O refreshment, it does not update the status of the disabled input points according to the actual external input. For the disabled output points, the result of logic scan can't override the disable status of outputs, only the user can force the state to 'on' or 'off' in order to simulate its operation. The user only needs to utilize the disable function combined with Monitor to achieve simulating the input or WinProladder and observe the result. Upon the finish the simulation, revert all the inputs or outputs to enable state will bring back normal operation. Refer the instructions of WinProladder for the operation of RUN/STOP controller, Disable/Enable I/O and monitoring of I/O status and content of register.

## Warning

The disable function is to let the input or output status out of program control and switched to the control of the user (tester) to freely set the disabled input or output to be ON or OFF. In normal controller operation, when dealing with input or output with safety issues (such as upper/lower limit of detected input or output emergency stop), the user must make sure whether it can be disabled or overridden to ON/OFF before starting the disable or override control, to avoid damage to equipment or harm to people.

### 8.3 LED Indicators on Controller Main Unit and Troubleshooting

#### Power Indicator "POW"

1. After the controller is power on, with correct power source and wiring, the "POW" LED indicator in the middle of the controller nameplate will turn on, indicating that power supply is normal. If the indicator is not on, please try to temporarily remove the wiring of 24VDC output power for Sensor. If the controller is back to normal, it means that the load on the power for the 24VDC input circuit is too large so that controller enters overload low voltage protection mode. (When controller enters overload low voltage protection mode, "POW" LED is off and there are slight and intermittent low frequency hissing sounds, from which one can tell if the 24VDC power is overloaded or shorted.)
2. When the above method still cannot turn on the "POW" LED, if it is confirmed that correct power input exists between controller power input L/N terminals or +/- (DC power), please send the unit to your local distributor for repair.

#### Operation Indicator "RUN"

As long as the CPU is working properly, in the STOP state, this indicator will go on and off for 2 seconds, respectively. When it's in the RUN state, the indicator will go on and off for 0.25 seconds, respectively. To make controller enter into Run state, or switch from RUN to STOP state, it has to be done through the programmer (WinProladder). Once controller is set to RUN or STOP, it will keep that state even after power off. The only exception is, when using the ROM PACK, no matter if it's running or stopped before power off, controller will automatically enter RUN state (with correct ROM PACK syntax check) when power is back. In normal operation of controller upon errors (e.g., errors in WDT timer and program), controller will automatically switch to STOP state and light the "ERR" error indicator. If it is a minor error, the RUN state can be resumed as long as the power is back after an outage. In case of serious errors, the controller cannot be operated again with the programmer until the problem is solved. If controller cannot be resumed to RUN state after all, please send it to your local distributor for repair.

### Error Indicator "ERR"

In normal controller operation, either in RUN or STOP state, this indicator will not show any signal (off). If it is on, it means that the system has an error (e.g., WDT time-out, program error, communication error, etc.)

If it is constantly on, please reset the power. If the situation is still the same, it implies a hardware failure in CPU and has to be sent to the distributor for repair.

When the ERR indicator flashes with a 0.5 sec interval, it means that some anomaly occurs to controller. At the same time, status indicators Y0~Y3 switch to serve as indications of 15 error codes (the corresponding outputs are disabled), which are described in the following :

Y3	Y2	Y1	Y0	Error Code	Description
0	0	0	1	1	Application program contains the functions not supported by this CPU
0	0	1	0	2	Mismatch of PLC ID VS. program ID
0	0	1	1	3	Check sum error in LADDER program
0	1	0	0	4	System STACK abnormal
0	1	0	1	5	Watch-Dog occurs
0	1	1	0	6	Exceed main unit I/O
0	1	1	1	7	Syntax check error occurs
1	0	0	0	8	Expansion I/O modules over limit
1	0	0	1	9	Expansion I/O points over limit
1	0	1	0	10	System FLASH ROM CRC error
1	0	1	1	11	Reserved
1	1	0	0	12	Reserved
1	1	0	1	13	Reserved
1	1	1	0	14	Reserved
1	1	1	1	15	Reserved

### Indicator on Transmit/Receive of Built-In Communication Port (Port0) "TX", "RX"

These two LED indicators are used for the status of transmit/receive of the built-in communication port (Port0). The RX indicator (green) is for indication when controller receives external signals, while the TX indicator (red) is for indication when controller transmits signals, both of which are very helpful in monitoring communication condition and debugging. When controller communicates with external equipment (computer, programmer, intelligent peripherals, etc.), Port0 can only be used in slave mode (Port1~2 can be used in master mode). Therefore, during its operation, controller must first receive external signals (RX on) before it can transmit signals back to external equipment (TX on now). When the communication is fail, one can tell if it's controller is not receiving signals or controller is not replying by looking at the these two indicators. The currents in these two LED are constant and their lighting duration is proportional to the reception or transmission time. The more received/transmitted data or the slower (bps) reception/transmission, the longer the reception/transmission time and so is the indication time (brighter visually). If in high speed but small amount of data, only short and dim brightness is observed. Therefore, the communication condition can be easily distinguished by these two indicators.

### Indicator of Input Status "Xn"

When external input Xn is ON, the corresponding LED indicator Xn will be on, otherwise it will be off. If it fails to respond to external input, please check if the terminal wiring is securely connected, or measure the voltage between "Xn" and common "C" to see if it has a change of 0V/22V with ON/OFF of input. If it does, it means that an error

occurs in controller input circuit or LED indicator. Or you can locate the problem by using the monitor mode of the programmer to check if this input status works correspondingly with the external input state.

#### Indicator of Output Status "Yn"

When the Yn output of controller is ON, its corresponding output indicator will also be on and its external load will be ON. If ON/OFF condition of external load is inconsistent with output indicator, please check the wiring of the load, power, and terminal for secure connection. If the connection is good, then it should be the controller output component failure. The main reasons to cause the output component failure are:

1. Overload or short circuit that burns output component and results in permanent open or short circuit.
2. Not overloaded, but Inrush current from capacitive load welds relay contacts at "ON" , resulting in permanent ON, or burns transistor, resulting in permanent ON or OFF.
3. Not overloaded, but the inductive load without proper snubber circuit causes high voltage sparks between relay contact at "OFF" and generate carbon deposition, which separates contacts and causes permanent OFF or intermittent ON/OFF, or punches through transistor with high voltage, resulting in permanent ON or OFF.

#### 8.4 Maintenance

WSZ controller itself has no user serviceable parts and all maintenance has to be conducted by professional personnel. During use, in case of any defective unit, please first try to find out the defect from the above error codes on the main unit, followed by performing maintenance over the entire unit or on the Board level. Send the unit that is still not functioning well to local distributors.

#### 8.5 The Charge of Battery & Recycle of Used Battery

Every WSZ controller main units have inside one re-chargeable lithium battery to safely maintain program and data during main power shut down. Each lithium battery was fully charged when the WSZ controller ship out from the factory capable to retain program and data at least 3 months. There is risk to miss program and data when battery exhaust over 3 months, the users should mind the date marked on each WSZ controller.

In case exceeding 3 months, users can do battery re-charging by themselves through keeping WSZ controller be powered for over 12 hours then more 3 months can work smoothly on the data saving.

#### Warning

Any recharge, disassembly, heating, burning on defective or discarded battery is prohibited. Otherwise may cause danger of explosion or fire. The chemical material of battery will lead to environment pollution, easily throw away or treat as normal garbage is prohibited. Please follow after the local or government's regulation to make proper treatment on discard battery.

## 【 *Instruction* 】

# Chapter 1 PLC Ladder Diagram

In this chapter, we would like to introduce you the basic principles of ladder diagram. If you are familiar with PLC Ladder Diagram, you may skip this chapter.

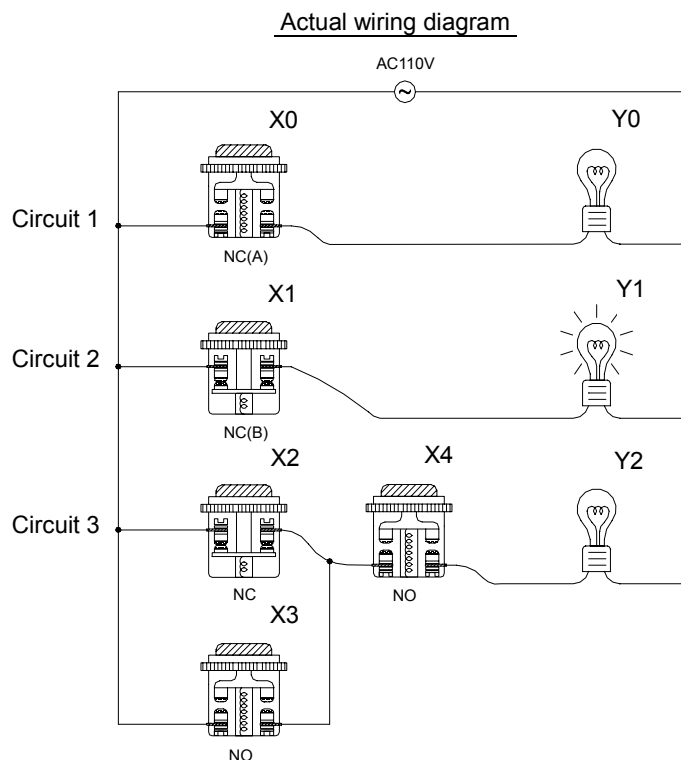

## 1.1 The Operation Principle of Ladder Diagram

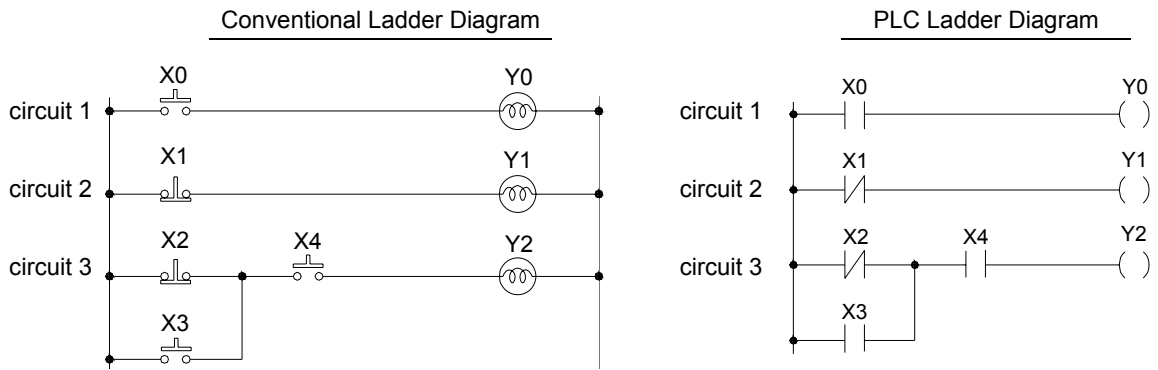

Ladder Diagram is a type of graphic language for automatic control systems it had been used for a long period since World War II. Until today, it is the oldest and most popular language for automatic control systems. Originally there are only few basic elements available such as A-contact (Normally OPEN), B contact (Normally CLOSE), output Coil, Timers and Counters. Not until the appearance of microprocessor based PLC, more elements for Ladder Diagram, such as differential contact, retentive coil (refer to page 1-6) and other instructions that a conventional system cannot provide, became available.

The basic operation principle for both conventional and PLC Ladder Diagram is the same. The main difference between the two systems is that the appearance of the symbols for conventional Ladder Diagram are more closer to the real devices, while for PLC system, symbols are simplified for computer display. There are two types of logic system available for Ladder Diagram logic, namely combination logic and sequential logic. Detailed explanations for these two logics are discussed below.

### 1.1.1 Combination Logic

Combination logic of the Ladder Diagram is circuits that combines one or more input elements in series or parallel and then send the results to the output elements, such as Coils, Timers/Counters, and other application instructions.

The above example illustrated the combination logic using the actual wiring diagram, conventional Ladder Diagram, and PLC Ladder Diagram. Circuit 1 uses a NO (Normally Open) switch that is also called "A" switch or contact. Under normal condition (switch is not pressed), the switch contact is at OFF state and the light is off. If the switch is pressed, the contact status turns ON and the light is on. In contrast, circuit 2 uses a NC (Normally Close) switch that is also called "B" switch or contact. Under normal condition, the switch contact is at ON state and the light is on. If the switch is pressed, the contact status turns OFF and the light also turns off.

Circuit 3 contains more than one input element. Output Y2 light will turn on under the condition when X2 is closed or X3 switches to ON, and X4 must switch ON too.

### 1.1.2 Sequential Logic

The sequential logic is a circuit with feedback control; that is, the output of the circuit will be feedback as an input to the same circuit. The output result remains in the same state even if the input condition changes to the original position. This process can be best explained by the ON/OFF circuit of a latched motor driver as shown in below.

Conventional Ladder Diagram

PLC Ladder Diagram

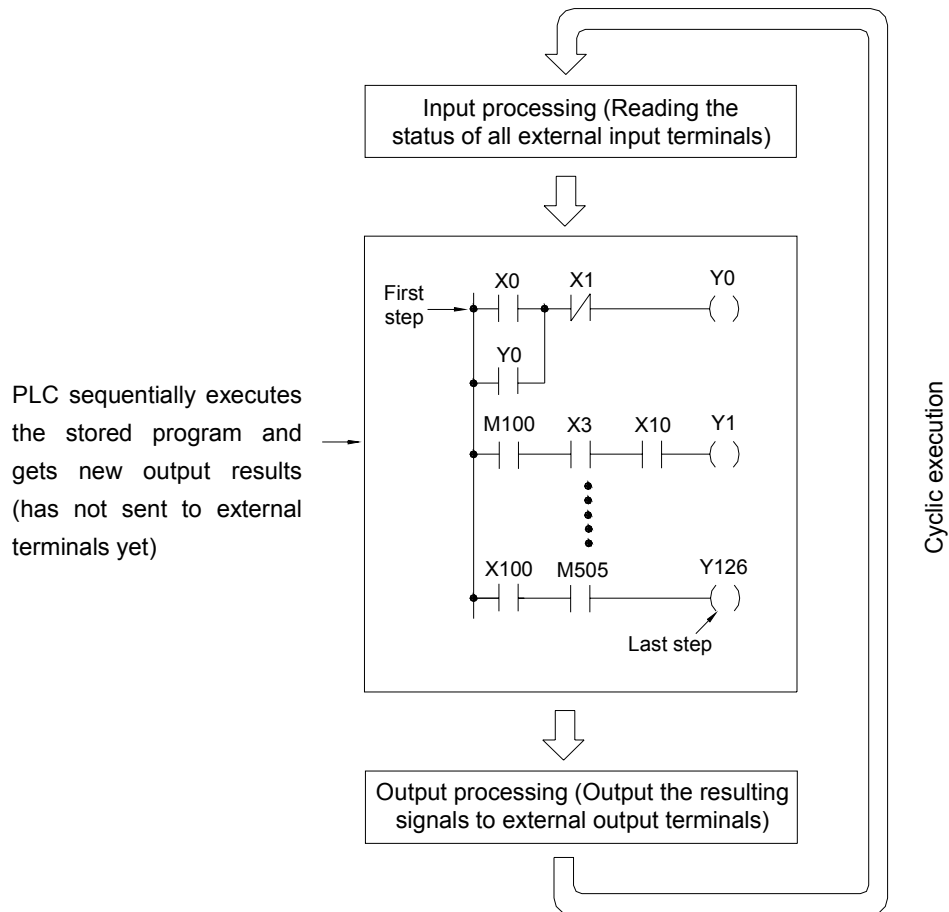

When we first connect this circuit to the power source, X6 switch is ON but X5 switch is OFF, therefore the relay Y3 is OFF. The relay output contacts 1 and 2 are OFF because they belong to A contact (ON when relay is ON). Motor does not run. If we press down the switch X5, the relay turns ON as well as contacts 1 and 2 are ON and the Motor starts. Once the relay turns ON, if we release the X5 switch (turns OFF), relay can retain its state with the feedback support from contact 1 and it is called Latch Circuit. The following table shows the switching process of the example we have discussed above.

	X5 switch (NO)	X6 switch (NC)	Motor (Relay) status
①	Released	Released	OFF
↓			
②	Pressed	Released	ON
↓			
③	Released	Released	ON
↓			
④	Released	Pressed	OFF
↓			
⑤	Released	Released	OFF

From the above table we can see that under different stages of sequence, the results can be different even the input statuses are the same. For example, let's take a look at stage ① and stage ③, X5 and X6 switches are both released, but the Motor is ON (running) at stage ③ and is OFF (stopped) at stage ①. This sequential control with the feedback of the output to the input is a unique characteristic of Ladder Diagram circuit. Sometimes we call the Ladder Diagram a "Sequential Control Circuit" and the PLC a "Sequencer". In this section, we only use the A/B contacts and output coils as the example. For more details on sequential instructions please refer to chapter 4 - "Sequential Instructions."

## 1.2 Differences Between Conventional and PLC Ladder Diagram

Although the basic operation principle for both conventional and PLC Ladder Diagram are the same, but in reality, PLC uses the CPU to emulate the conventional Ladder Diagram operations; that is, PLC uses scanning method to monitor the statuses of input elements and output coils, then uses the Ladder Diagram program to emulate the results which are the same as the results produced by the conventional Ladder Diagram logic operations. There is only one CPU, so the PLC has to sequentially examine and execute the program from its first step to the last step, then returns to the first step again and repeats the operation (cyclic execution). The duration of a single cycle of this operation is called the scan time. The scan time varies with the program size. If the scan time is too long, then input and output delay will occur. Longer delay time may cause big problems in controlling fast response systems. At this time, PLCs with short scan time are required. Therefore, scan time is an important specification for PLCs. Due to the advance in microcomputer and ASIC technologies nowadays the scan speed has been enhanced a great deal. For example, in the case of WSZ-Controller, the scan process speed of the contact of 1k step is 0.33ms. The following diagram illustrates the scanning process of a PLC Ladder Diagram.

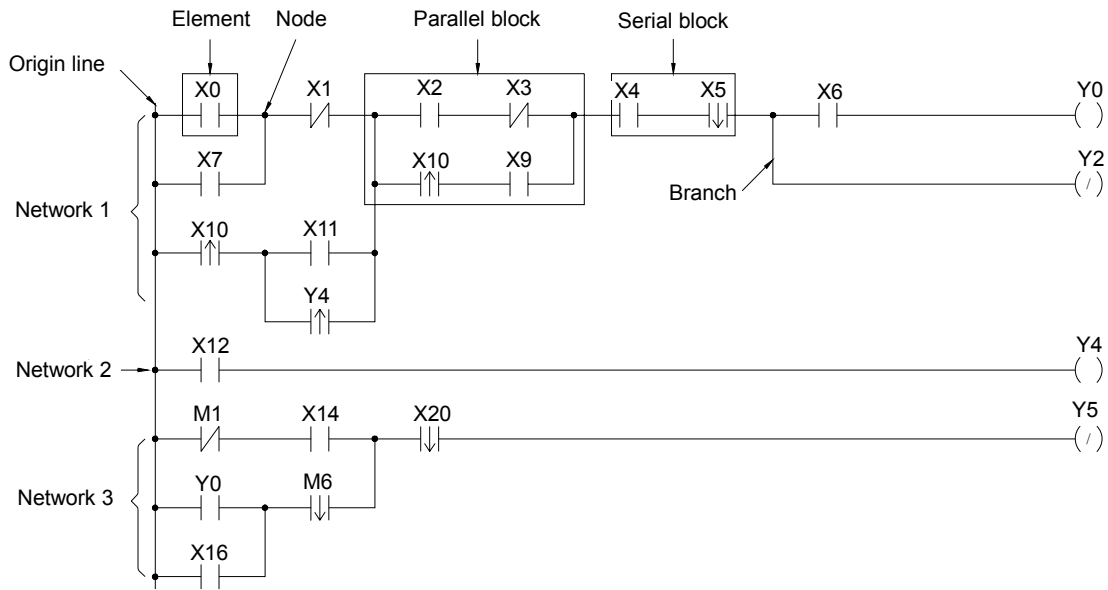

Besides the time scan difference mentioned above, the other difference between the conventional and PLC Ladder Diagram is “Reverse flow” characteristic. As shown in the diagram below, if X0, X1, X4 and X6 are ON, and the remaining elements are OFF. In a conventional Ladder Diagram circuit, a reverse flow route for output Y0 can be defined by the dashed line and Y0 will be ON. While for PLC, Y0 is OFF because the PLC Ladder Diagram scans from left to right, if X3 is off then CPU believes node “a” is OFF, although X4 and node “b” are all ON, since the PLC scan reaches X3 first. In other words, the PLC ladder can only allow left to right signal flow while conventional ladder can flow bi-directional.

Reverse flow of conventional Ladder diagram

## 1.3 Ladder Diagram Structure and Terminology

Sample Ladder Diagram

(Remark : The maximum size of WSZ-controller network is 16 rows X 22 columns)

As shown above, the Ladder Diagram can be divided into many small cells. There are total 88 cells (8 rows X 11 columns) for this example Ladder Diagram. One cell can accommodate one element. A completed Ladder Diagram can be formed by connecting all the cells together according to the specific requirements. The terminologies related to Ladder Diagram are illustrated below.

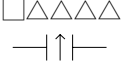

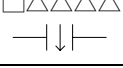

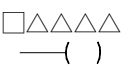

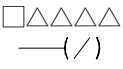

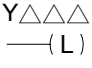

① Contact

Contact is an element with open or short status. One kind of contact is called "Input contact"(reference number prefix with X) and its status reference from the external signals (the input signal comes from the input terminal block).The relation between the reference number and the contact status depends on the contact type. The contact elements provided by WSZ series controller include: A contact, B contact, up/down differential contacts and Open/Short contacts. Please refer to ③ for more details.

② Origin-line: The starting line at the left side of the Ladder Diagram.

③ Element: Element is the basic unit of a Ladder Diagram. An element consists of two parts as shown in the diagram below. One is the element symbol which is called "OP Code" and another is the reference number part which is called "Operand".

Element type	Symbol	Remark
A Contact (Normally OPEN)		□ can be X · Y · M · S · T · C (please refer to section 3.2)
B Contact (Normally CLOSE)		
Up Differential Contact		□ can be X · Y · M · S
Down Differential Contact		
Open Circuit Contact		
Short Circuit Contact		
Output Coil		□ can be Y · M · S
Inverse Output Coil		
Latching Output Coil		

Remark : please refer to section 2.2 for the ranges of X · Y · M · S · T and C contacts. Please refer to section 4.2 for the characteristics of X · Y · M · S · T and C contacts.

There are three special sequential instructions, namely OUT TRn, LD TRn and FOn, which were not displayed on the Ladder Diagram. Please refer to section 5.1.4 “Function Output FO”.

④ Block: a circuit consists of two or more elements.

There are two basic types of blocks:

- Serial block : Two or more elements are connected in series to form a single row circuit.

Example:

- Parallel block: Parallel block is a type of a parallel closed circuit formed by connecting elements or serial blocks in parallel.

Example:

Remark: Complicated block can be formed by the combination of the single element, serial blocks and parallel blocks.

⑤ Branch: In any network, branch is obtained if the right side of a vertical line is connected with two or more rows of circuits.

Example:

Merge line is defined as another vertical line at the right side of a branch line that merges the branch circuits into a closed circuit (forming a parallel block). This vertical line is called "Merge line".

If both the right and the left sides of the vertical line are connected with two or more rows of circuits, then it is both a branch line and a merge line as shown in the example below.

Example:

⑥ Network: Network is a circuit representing a specified function. It consists of the elements, branches, and blocks. Network is the basic unit in the Ladder Diagram which is capable of executing the completed functions, and the program of Ladder Diagram is formed by connecting networks together. The beginning of the network is the origin line. If two circuits are connected by a vertical line, then they belong to the same network. If there is no vertical line between the two circuits, then they belong to two different networks. Figure 1, shows three (1~3) networks.

# Chapter 2 WSZ-Controller Memory Allocation

## 2.1 WSZ-Controller Memory Allocation

Remark:

1. When the Read Only Register (ROR) has been configured by the user, the contents of R5000~R8071 (depends on the quantity of configuration) will be loaded from the ROR's during each time of power up or changing from STOP to RUN mode. The user can access the ROR through the corresponding R5000~R8071. Write operation of function instructions are prohibited in this ROR area of corresponding R5000~R8071. The others of R5000~R8071 that have not been configured for ROR, they can work as general purpose registers.
2. There is a dedicated area of program memory to store the contents of Read Only Register. ROR can be configured up to 3072 words in maximum.

## 2.2 Digital and Register Allocations

“\*” is default, user configurable

Type	Symbol	Item		Range	Remarks		
Digital 《 Bit Status 》	X	Digital Input (DI)		X0~X255 (256)	Mapping to external digital I/O		
	Y	Digital Output (DO)		Y0~Y255 (256)			
	TR	Temporary Relay		TR0~TR39 (40)	For branched points		
	M	Internal Relays	Non-Retentive		M0~M799 (800)* M1400~M1911 (512)	M0~M1399 configurable as Non-retentive or Retentive, M1400~M1911 are fixed to Non-retentive	
			Retentive		M800~M1399 (600)*		
		Special Relay		M1912~M2001 (90)			
	S	Step Relays	Non-Retentive		S0~S499 (500)*	S20~S499 configurable as Retentive	
			Retentive		S500~S999 (500)*	S500~S999 configurable as Non-retentive	
T	Timer contact status		T0~T255 (256)				
C	Counter contact status		C0~C255 (256)				
Register 《 Word Data 》	TMR	CV of Timer Register	0.01S Time Base		T0~T49 (50)*	The quantity of each time base can be configured	
			0.1S Time Base		T50~T199 (150)*		
			1S Time Base		T200~T255 (56)*		
	CTR	CV of Counter Register	16-bit	Retentive		C0~C139 (140)*	Configurable as Non-retentive
				Non-Retentive		C140~C199 (60)*	Configurable as Retentive
			32-bit	Retentive		C200~C239 (40)*	Configurable as Non-retentive
				Non-Retentive		C240~C255 (16)	Configurable as Retentive
	HR or DR	Data Registers	Retentive		R0~R2999 (3000)* D0~D3999 (4000)	R0~R3839 configurable as Non-retentive or Retentive, D0~D3999 are fixed to Retentive	
			Non-Retentive		R3000~R3839 (840)*		
	HR or ROR	Data Registers	Retentive		R5000~R8071(3072)*	As general purpose registers if ROR not been configured.	
			Read Only Registers		R5000~R8071(0)*	Configurable as ROR for recipe like application	
	IR	Input Registers		R3840~R3903 (64)		Map to external AI Register input	
	OR	Output Registers		R3904~R3967 (64)		Map to external AO /Register output	
	SR	System Special Registers		R3968~R4167 (200) D4000~D4095 (96)			
	Special Register	0.1ms High-Speed Timer Register		R4152~R4154 (3)			
		HSC Registers	Hardware (4sets)		DR4096~DR4110 (4x4)		
			Software(4sets)		DR4112~DR4126 (4x4)		
Calendar Registers		Minute	Second	R4129	R4128		
		Day	Hour	R4131	R4130		
		Year	Month	R4133	R4132		
		Week		R4134			
FR	File Registers		F0~F8191(8192)		Need dedicated instruction to access		
XR	Index Registers		V,Z (2), P0~P9 (10)				

Remark: During power up or changing operation mode from STOP→RUN, all contents in non-retentive relays or registers will be cleared to 0; the retentive relays or registers will remain the same state as before.

### 2.3 Special Relay Details

Relay No.	Function	Description
1. Stop, Prohibited Control		
M1912	Emergency Stop control	<ul style="list-style-type: none"> <li>• If ON, controller will be stopped and all outputs OFF. This bit will be cleared when power up or changing operation mode from STOP→RUN.</li> </ul>
M1913	Disable external outputs control	<ul style="list-style-type: none"> <li>• All external outputs are turn off but the status of Y0~Y255 inside the controller will not be affected.</li> </ul>
M2001	Disable/Enable status retentive control	<ul style="list-style-type: none"> <li>• If M2001 is 0 or enabled, the Disable/Enable status of all contacts will be reset to enable during power up or changing operation mode from STOP→RUN.</li> <li>• If M2001 is disabled and force ON, the Disable/Enable status &amp; ON/OFF state of all contacts will remain as before during power up or changing operation mode from STOP→RUN. While testing, it may disable and force ON M2001 to keep the ON/OFF state of disabled contacts, but don't forget to enable the M2001 after testing.</li> </ul>
2. CLEAR Control		
M1914	Clear Non-Retentive Relays	<ul style="list-style-type: none"> <li>• Cleared When at 1</li> </ul>
M1915	Clear Retentive Relays	<ul style="list-style-type: none"> <li>• Cleared When at 1</li> </ul>
M1916	Clear Non-Retentive Registers	<ul style="list-style-type: none"> <li>• Cleared When at 1</li> </ul>
M1917	Clear Retentive Registers	<ul style="list-style-type: none"> <li>• Cleared When at 1</li> </ul>
M1918	Master Control (MC) Selection	<ul style="list-style-type: none"> <li>• If 0, the pulse activated functions within the master control loop will only be executed once at first 0→1 of master control loop. If 1, the pulse activated functions within the master control loop will be executed every time while changing 0→1 of master control loop.</li> </ul>
M1919	Function output control	<ul style="list-style-type: none"> <li>• If 0, the functional outputs of some function instructions will memory the output state, even these instructions not been executed. If 1, the functional output of some function instructions without the memory ability.</li> </ul>
※ M1918/M1919 can be set to 0 or 1 at will around the whole program to meet the control requirements.		

Relay No.	Function	Description
<b>3. Pulse Signals</b>		
M1920 M1921 M1922 M1923 M1924  M1925 M1926	0.01S Clock pulse 0.1S Clock pulse 1S Clock pulse 60S Clock pulse Initial pulse (first scan) ②  Scan clock pulses ③ =0, Controller is working at STOP mode =1, Controller is working at RUN mode	<p>T(M1920)=0.01S            T(M1921)=0.1S            T(M1922)=1S            T(M1923)=60S</p>
M1927	CTS input status of communication port 1	<ul style="list-style-type: none"> <li>• 0 : CTS True (ON)</li> <li>• 1 : CTS False (OFF)</li> <li>• When communication port 1 is used to connect with the printer or modem, it can use this signal and a timer to detect whether the printer or the modem is ready.</li> </ul>
<b>4. Error Messages</b>		
M1928 M1929 M1930 M1931 M1932 M1933 M1934   M1935	Reserved Reserved No expansion unit or exceed the limit on number of I/O points Immediate I/O not in the main unit range Unused System stack error  Reserved	<ul style="list-style-type: none"> <li>• 1: Indicating no expansion unit or exceed the limit on number of I/O points</li> <li>• 1: Indicating that Immediate I/O not in the main unit range and the main unit cannot RUN</li> <li>• 1: Indicating that system stack error</li> </ul>
<b>5. Port3~Port4 Controls ( Not used )</b>		
M1936	Port 3 busy indicator	<ul style="list-style-type: none"> <li>• 0 : Port 3 Busy</li> <li>• 1 : Port 3 Ready</li> </ul>
M1937	Port 3 finished indicator	<ul style="list-style-type: none"> <li>• 1 : Port 3 finished all communication transactions</li> </ul>
M1938	Port 4 busy indicator	<ul style="list-style-type: none"> <li>• 0 : Port 4 Busy</li> <li>• 1 : Port 4 Ready</li> </ul>
M1939	Port 4 finished indicator	<ul style="list-style-type: none"> <li>• 1 : Port 4 finished all communication transactions</li> </ul>

Relay No.	Function	Description
6. HSC0/HSC1 Controls		
M1940	HSC0 software Mask	• 1: Mask
M1941	HSC0 software Clear	• 1: Clear
M1942	HSC0 software Direction	• 0: Count-up, 1: Count-down
M1943	Reserved	
M1944	Reserved	
M1945	Reserved	
M1946	HSC1 software Mask	• 1: Mask
M1947	HSC1software Clear	• 1: Clear
M1948	HSC1 software Direction	• 0: Count-up, 1: Count-down
M1949	Reserved	
M1950	Port 3 status	• 1: Port 3 has received and transmitted a message ( Not used )
M1951	Port 4 status	• 1: Port 4 has received and transmitted a message ( Not used )
7. RTC Controls		
M1952	RTC setting	
M1953	±30 second Adjustment	
■M1954	RTC installation checking	
■M1955	Set value error	
8. Communication/Timing/Counting Controls		
M1956	Selection of Message Fame Interval Detection Time	• 0: Use system default value as Message Fame Interval Detection Time for Modbus RTU communication protocol • 1 : Use the high byte value of R4148 as Message Fame Interval Detection Time for Modbus RTU protocol
M1957	The CV value control after the timer "Time Up"	• 0: The CV value will continue timing until the upper limit is met after "Time Up" • 1: The CV value will stop at the PV value after "Time Up" (User may control M1957 within the program to control the individual timer )
M1958	Communication port 2 High Speed Link mode selection	• 0: Set Port 2 to Normal Speed Link • 1: Set Port 2 to High Speed CPU Link ※M1958 is only effective at slave station
M1959	Modem dialing signal selection	• 0: Dialing by TONE when Port 1 connecting with Modem. • 1: Dialing by PULSE when Port 1 connecting with Modem.
M1960	Port 1 busy indicator	• 0 : Port 1 Busy • 1 : Port 1 Ready
M1961	Port 1 finished indicator	• 1 : Port 1 finished all communication transactions
M1962	Port 2 busy indicator	• 0 : Port 2 Busy • 1 : Port 2 Ready
M1963	Port 2 finished indicator	• 1 : Port 2 finished all communication transactions
M1964	Modem dialing control	• If Port 1 is connected with Modem, when signal 0→1 will dial the phone number; when signal 1→0 will hang-up the phone.

Relay No.	Function	Description
M1965	Dialing success flag	<ul style="list-style-type: none"> <li>• 1: Indicating that dialing is successful (when Port 1 is connected with Modem).</li> </ul>
M1966	Dialing fail flag	<ul style="list-style-type: none"> <li>• 1: Indicating that dialing has failed (when Port 1 is connected with Modem).</li> </ul>
M1967	Port 2 High Speed Link working mode selection	<ul style="list-style-type: none"> <li>• 0: Continuous cycle.</li> <li>• 1: One cycle only. It will stop when the last communication transaction is completed (only effective at the master station).</li> </ul>
M1968	Step program status	<ul style="list-style-type: none"> <li>• 1: Indicating that there are more than 16 active steps in the step program at the same time.</li> </ul>
M1969	Indirect addressing illegal write flag	<ul style="list-style-type: none"> <li>• 1: Indicating that a function with index addressing attempts to write cross over the boundary of different type of data.</li> </ul>
M1970	Port 0 status	<ul style="list-style-type: none"> <li>• 1: Port 0 has received and transmitted a message</li> </ul>
M1971	Port 1 status	<ul style="list-style-type: none"> <li>• 1: Port1 has received and transmitted a message</li> </ul>
M1972	Port 2 status	<ul style="list-style-type: none"> <li>• 1: Port2 has received and transmitted a message</li> </ul>
M1973	The CV value control after counting "Count-Up"	<ul style="list-style-type: none"> <li>• 0: Indicating that the CV value will continue counting up to the upper limit after "Time-Up".</li> <li>• 1: Indicating that the CV value will stop at the PV value after "Count-Up" ( User may control M1973 within the program to control the individual counter )</li> </ul>
M1974	RAMP function (FUN95) slope control	<ul style="list-style-type: none"> <li>• 0: Time control for ramping</li> <li>• 1: Equivalent slope control for ramping</li> </ul>
M1975	CAM function (FUN112) selection	<ul style="list-style-type: none"> <li>• 1: For the circular applications where the electric CAM switch (FUN112) can support the wrap around situation like the angle from 359° cross to 0°</li> </ul>
9. HSC2~HSC7 Controls		
M1976	HSC2 software Mask	<ul style="list-style-type: none"> <li>• 1: Mask</li> </ul>
M1977	HSC2 software Clear	<ul style="list-style-type: none"> <li>• 1: Clear</li> </ul>
M1978	HSC2 software Direction	<ul style="list-style-type: none"> <li>• 0: Count-up, 1: Count-down</li> </ul>
M1979	HSC3 software Mask	<ul style="list-style-type: none"> <li>• 1: Mask</li> </ul>
M1980	HSC3 software Clear	<ul style="list-style-type: none"> <li>• 1: Clear</li> </ul>
M1981	HSC3 software Direction	<ul style="list-style-type: none"> <li>• 0: Count-up, 1: Count-down</li> </ul>
M1982	HSC4 software Mask	<ul style="list-style-type: none"> <li>• 1: Mask</li> </ul>
M1983	HSC4 software Direction	<ul style="list-style-type: none"> <li>• 0: Count-up, 1: Count-down</li> </ul>
M1984	HSC5 software MASK	<ul style="list-style-type: none"> <li>• 1: Mask</li> </ul>
M1985	HSC5 software Direction	<ul style="list-style-type: none"> <li>• 0: Count-up, 1: Count-down</li> </ul>
M1986	HSC6 software Mask	<ul style="list-style-type: none"> <li>• 1: Mask</li> </ul>
M1987	HSC6 software Direction	<ul style="list-style-type: none"> <li>• 0: Count-up, 1: Count-down</li> </ul>
M1988	HSC7 software Mask	<ul style="list-style-type: none"> <li>• 1: Mask</li> </ul>
M1989	HSC7 software Direction	<ul style="list-style-type: none"> <li>• 0: Count-up, 1: Count-down</li> </ul>
M1990	Reserved	

Relay No.	Function	Description
10. PSO0~PSO3 Controls		
M1991	Selection of stopping the pulse output (FUN140, FUN147)	<ul style="list-style-type: none"> <li>• 0 : Immediately stop while stopping pulse output</li> <li>• 1 : Slow down stop while stopping pulse output</li> </ul>
M1992	PSO0 Busy indicator	<ul style="list-style-type: none"> <li>• 0 : PSO0 Busy</li> <li>• 1 : PSO0 Ready</li> </ul>
M1993	PSO1 Busy indicator	<ul style="list-style-type: none"> <li>• 0 : PSO1 Busy</li> <li>• 1 : PSO1 Ready</li> </ul>
M1994	PSO2 Busy indicator	<ul style="list-style-type: none"> <li>• 0 : PSO2 Busy</li> <li>• 1 : PSO2 Ready</li> </ul>
M1995	PSO3 Busy indicator	<ul style="list-style-type: none"> <li>• 0 : PSO3 Busy</li> <li>• 1 : PSO3 Ready</li> </ul>
M1996	PSO0 Finished indicator	<ul style="list-style-type: none"> <li>• 1 : PSO0 finished the last step of motion</li> </ul>
M1997	PSO1 Finished indicator	<ul style="list-style-type: none"> <li>• 1 : PSO1 finished the last step of motion</li> </ul>
M1998	PSO2 Finished indicator	<ul style="list-style-type: none"> <li>• 1 : PSO2 finished the last step of motion</li> </ul>
M1999	PSO3 Finished indicator	<ul style="list-style-type: none"> <li>• 1 : PSO3 finished the last step of motion</li> </ul>
M2000	Selection of Multi-Axis synchronization for High Speed Pulse Output (FUN140, FUN147)	<ul style="list-style-type: none"> <li>• 1: Synchronized Multi-Axis</li> </ul>

## 2.4 Special Registers Details

Register No.	Function	Description
R3840   R3903	Input Registers CH0 : R3840     CH63 : R3903	For Analog inputs
R3904   R3967	Output Registers CH0 : R3904     CH63 : R3967	For Analog outputs
R3968   R3980	Define stimulate Modbus equipment	
R3981   R3999	Reserved	
R4000	Reserved	
R4001	Reserved	
R4002	Reserved	
R4003   R4004	Define FUN86 temperature reading value at starting/end address	
R4005	High Byte : Period of PWM =0, 2 seconds =1, 4 seconds =2, 8 seconds =3, 1 second =4, 16 seconds ≥5, 32 seconds Low Byte : Period of PID calculation =0, 2 seconds =1, 4 seconds =2, 8 seconds =3, 1 second =4, 16 seconds ≥5, 32 seconds	For PID temperature control
R4006	Threshold value of output ratio for heating/cooling loop abnormal detecting (Unit in %)	For PID temperature control
R4007	Threshold value of continuous time for heating/cooling loop abnormal detecting (Unit in second)	For PID temperature control
R4008	Maximum temperature for heating loop abnormal detecting	For PID temperature control
R4009	Temperature display in Celsius/Fahrenheit	=0, Celsius ;=1,Fahrenheit

Register No.	Function	Description
R4010   R4011	Installed temperature sensor flag	Each bit represents 1 sensor, if bit value = 1 means installed.
R4012   R4013	PID Temperature control flag	Each bit represents 1 temperature point, if bit value = 1 means enable control.
R4014	Reserved	
R4015	Averaging of temperature value =0, no average on temperature =1, average by two readings =2, average by four readings =3, average by eight readings	
R4016	Reserved	
R4017	Reserved	
R4018	Reserved	
R4019	Number of PASSWORD Retry	
R4020	Control FUN148 instruction forbid to clockwise/anti-clockwise.	
R4021   R4024	Reserved	
R4025 R4026 R4027 R4028	Total Expansion Input Registers Total Expansion Output Registers Total Expansion Digital Inputs Total Expansion Digital Outputs	
R4029	Reserved for system	
R4030   R4039	Tables to save or read back the data registers into or from ROM Pack	When the ROM Pack being used to save the ladder program and data registers, these tables describes which registers will be written into the ROM Pack. The addressed registers will be initialized from ROM Pack while power up.
R4040	Reply delay time settings for Port 0 and Port 1	Low Byte : For Port 0 (Unit in ms) High Byte : For Port 1 (Unit in ms)
R4041	Reply delay time settings for Port 2 and Port 3	Low Byte : For Port 2 (Unit in ms) High Byte : For Port 3 (Unit in ms, Not used)
R4042	Reply delay time settings for Port 4	Low Byte : For Port 4 (Unit in ms, Not used) High Byte : Reserved for system
R4043	Port 3 Communication Parameters Register	Set Baud Rate, Data bit...of Port 3 (Not used)
R4044	Port 4 Communication Parameters Register	Set Baud Rate, Data bit...of Port 4 (Not used)
R4045	Transmission Delay & Receive Time-out interval time Setting, while Port 3 being used as the master of FUN151 or FUN150	Low Byte : Port 3 Receive Time-out interval time (Unit in 10ms, Not used) High Byte : Port 3 Transmission Delay (Unit in 10ms, Not used)

Register No.	Function	Description
R4046	Power up initialization mode selection of data registers that has been written into ROM Pack.	=5530H: Don't initialize the addressed data registers been written into ROM Pack while power up =Others : initialize the addressed data registers been written into ROM Pack while power up
R4047	Communication protocol setting for Port1 ~ Port2	Set the Modbus RTU communication protocol
R4048	Transmission Delay & Receive Time-out interval time Setting, while Port 4 being used as the master of FUN151 or FUN150	Low Byte : Port 4 Receive Time-out interval time (Unit in 10ms, Not used) High Byte : Port 4 Transmission Delay (Unit in 10ms, Not used)
R4049	CPU Status Indication	=A55AH, Force CPU RUN =0, Normal Stop =1, Function(s) existed that CPU does not support =2, PLC ID not matched with Program ID =3, Ladder checksum error =4, System STACK error =5, Watch-Dog error =6, Immediate I/O over the CPU limitation =7, Syntax not OK =8, Qty of expansion I/O modules exceeds =9, Qty of expansion I/O points exceeds =10, CRC error of system FLASH ROM
R4050	Port 0 Communication Parameters Register	Set Baud Rate of Port 0
R4051	Reserved	
R4052	Indicator while writing ROM Pack	
R4053	Reserved	
R4054	Define the master station number of the High-Speed CPU Link network (FUN151 Mode 3)	If the master station number is 1, it can ignore this register. To set the master station number other than 1 should: Low Byte : Station number High Byte: 55H
R4055	Controller station number	<ul style="list-style-type: none"> <li>If high byte is not equal 55H, R4055 will show the station number of this controller</li> <li>If want to set controller station number then R4055 should set to:</li> </ul> Low Byte : Station number High Byte: 55H
R4056	High Byte :Reserved Low Byte: High speed pulse output frequency dynamic control	Low Byte: =5AH, can dynamically change the output frequency of High Speed Pulse Output
R4057	Power off counter	The value will be increased by 1 while power up
R4058	Error station number while Port 2 in High Speed CPU Link	Used by FUN151 Mode 3 of Port 2

Register No.	Function	Description						
R4059	Error code while Port 2 in High Speed CPU LINK mode	Used by FUN151 Mode 3 of Port 2 <div style="text-align: center;"> <table border="1" style="margin: auto;"> <tr> <td style="padding: 2px;">High byte</td> <td style="padding: 2px;">Low Byte</td> </tr> <tr> <td style="padding: 2px;">R4059</td> <td style="padding: 2px;"> <table border="1" style="display: inline-table; vertical-align: middle;"> <tr> <td style="padding: 2px;">Err code</td> <td style="padding: 2px;">Err count</td> </tr> </table> </td> </tr> </table> </div> Error code : 0AH, No response 01H, Framing Error 02H, Over-Run Error 04H, Parity Error 08H, CRC Error	High byte	Low Byte	R4059	<table border="1" style="display: inline-table; vertical-align: middle;"> <tr> <td style="padding: 2px;">Err code</td> <td style="padding: 2px;">Err count</td> </tr> </table>	Err code	Err count
High byte	Low Byte							
R4059	<table border="1" style="display: inline-table; vertical-align: middle;"> <tr> <td style="padding: 2px;">Err code</td> <td style="padding: 2px;">Err count</td> </tr> </table>	Err code	Err count

R4139	CPU Status	Bit0 =0, Controller STOP =1, Controller RUN Bit1 , Reserved Bit2 =1, Ladder program checksum error Bit3 =0, Without ROM Pack =1, With ROM Pack Bit4 =1, Watch-Dog error Bit5 =1, MA model main unit (Not used) Bit6 =1, With ID protection Bit7 =1, Emergency stop Bit8 =1, Immediate I/O over range Bit9 =1, System STACK error Bit10 =1, ASIC failed Bit11 =1, Function not allowed (Use the instruction of non-support) Bit12 , Reserved Bit13 , Reserved Bit14 =1, With calendar Bit15 =1, MC main unit
R4140 R4141 R4142 R4143 R4144 R4145	} Telephone Number	

Register No.	Function	Description
R4146	Port 1 Communication Parameters Register	Set Baud Rate, Data bit... of Port 1
R4147	Transmission Delay & Receive Time-out interval time Setting, while Port 1 being used as the master of FUN151 or FUN150	Low Byte : Port 1 Receive Time-out interval time (Unit in 10ms) High Byte : Port 1 Transmission Delay (Unit in 10ms)
R4148	Message Frame Detection Time Interval	.While the communication port being used as the master or slave of Modbus RTU protocol, the system will give the default time interval to identify each packet of receiving message; except this, the user can set this time interval through the high byte setting of R4148 and let M1956 be 1, to avoid the overlap of different packet of message frame.  M1956=1, High Byte of R4148 is used to set the new message detection time interval for Port 1 ~ Port 2 (Unit in ms)  .While the communication port being used to communicate with the intelligent peripherals through FUN151 instruction, if the communication protocol without the end of text to separate each packet of message frame, it needs message detection time interval to identify the different packet. High byte of R4148 is used for this setting for Port 1 ~ Port 2.  (Unit in ms)
R4149	Modem Interface Setting & Port0 without checking of station number for Original external communication protocol	<ul style="list-style-type: none"> <li>• High Byte of R4149: =55H, Remote-Diagnosis/Remote-CPU-Link by way of Port 1 through Modem connection, it supports user program controlled dial up function</li> <li>=AAH, Remote diagnosis by way of Port 1 through Modem connection, it supports Passive receiving &amp; Active dialing operation mode</li> <li>=Others, without above function</li> <li>• Low Byte of R4149: =1, Port 0 without checking of station number for Original external communication protocol (communicating with HMI/SCADA)</li> <li>=Others, Port 0 checks station number, it allows multi-drop network for data acquisition.</li> </ul>
R4150	Power on I/O service delay time setting	• Controller is ready for I/O service after this delay time while power up. The unit is in 0.01s. The default value is 100.
R4151	Circular 1mS time base timer	• The content of R4151 will be increased by 1 every 1ms. It can be used for a more precise timing application.
R4152	Low word of HSTA CV register	HSTA is high speed timer in 0.1 ms resolution.
R4153	High word of HSTA CV register	The HSTA can act as 32-bit cyclic timer or fixed time interrupt timer.
R4154	PV register of HSTA	

Register No.	Function	Description																
R4155	Port 1 & Port 2 without station number checking for original external communication protocol	<ul style="list-style-type: none"> <li>• Low Byte of R4155:               <ul style="list-style-type: none"> <li>=1, Port 1 without station number checking for original external communication protocol (communicating with HMI/SCADA)</li> <li>=Others, Port 1 checks station number, it allows multi-drop network for data acquisition</li> </ul> </li> <li>• High Byte of R4155:               <ul style="list-style-type: none"> <li>=1, Port 2 without station number checking for original external communication protocol (communicating with MMI/SCADA)</li> <li>=Others, Port 2 checks station number, it allows multi-drop network for data acquisition</li> </ul> </li> </ul>

D4090   D4095	Reserved	

Remark: All the special relays or registers attached with “▼” symbol shown in the above table are write prohibited.

For the special relays attached with “▼” symbol also has following characteristics

- . Forced and Enable/Disable operation is not allowed.
- . Can't be referenced by TU/TD transitional contact (contact will always open)

# Chapter 3 WSZ-Controller Instruction Lists

## 3.1 Sequential Instructions

Instruction	Operand	Symbol	Function Descriptions	Execution Time	Instruction type
ORG	X,Y,M, S,T,C		Starting a network with a normally open (A) contact	0.33us	Network starting instructions
ORG NOT			Starting a network with a normally closed (B) contact		
ORG TU			Starting a network with a differential up (TU) contact	0.54us	
ORG TD			Starting a network with a differential down (TD) contact		
ORG OPEN			Starting a network with an open circuit contact	0.33us	
ORG SHORT			Starting a network with a short circuit contact		
LD	X,Y,M, S,T,C		Starting a relay circuit from origin or branch line with a normally open contact	0.33us	Origin or branch line starting instructions
LD NOT			Starting a relay circuit from origin or branch line with a normally closed contact		
LD TU			Starting a relay circuit from origin or branch line with a differential up contact	0.54us	
LD TD			Starting a relay circuit from origin or branch line with a differential down contact		
LD OPEN			Starting a relay circuit from origin or branch line with an open circuit contact	0.33us	
LD SHORT			Starting a relay circuit from origin or branch line with a short circuit contact		
AND	X,Y,M, S,T,C		Serial connection of normally open contact	0.33us	Serial connection instructions
AND NOT			Serial connection of normally closed contact		
AND TU			Serial connection of differential up contact	0.54us	
AND TD			Serial connection of differential down contact		
AND OPEN			Serial connection of open circuit contact	0.33us	
AND SHORT			Serial connection of short circuit contact		
OR	X,Y,M, S,T,C		Parallel connection of normally open contact	0.33us	Parallel connection instructions
OR NOT			Parallel connection of normally closed contact		
OR TU			Parallel connection of differential up contact	0.54us	
OR TD			Parallel connection of differential down contact		
OR OPEN			Parallel connection of open circuit contact	0.33us	
OR SHORT			Parallel connection of short circuit contact		
ANDLD			Serial connection of two circuit blocks	0.33us	Blocks merge instructions
ORLD			Parallel connection of two circuit blocks		

Instruction	Operand	Symbol	Function Descriptions	Execution Time	Instruction type
OUT	Y,M,S	—( )	Send result to coil	0.33us   1.09us	Coil output instruction
OUT NOT		—(/)	Send inverted result to coil		
OUT L	Y	—(L)	Send result to an external output coil and appoint it as of retentive type		
OUT	TR		Save the node status to a temporary relay	0.33us	Node operation instruction
LD			Load the temporary relay		
TU		—↑—	Take the transition up of the node status	0.33us	
TD		—↓—	Take the transition down of the node status	0.33us	
NOT		—/—	Invert the node status	0.33us	
SET		←(S)	Set a coil	0.33us   1.09us	
RST		←(R)	Reset a coil	0.33us   1.09us	

- The 36 sequential instructions listed above are all applicable to every models of WSZ-controller.

### 3.2 Function Instructions

There are more than 100 different WSZ-Controller function instructions. If put the “D” and “P” derivative instructions into account, the total number of instructions is over 300. On top of these, many function instructions have multiple input controls (up to 4 inputs) which can have up to 8 different types of operation mode combinations. Hence, the size of WSZ-controller instruction sets is in fact not smaller than that of a large controller. Having powerful instruction functions, though may help for establishing the complicated control applications, but also may impose a heavy burden on those users of small type controller's. For ease of use, WSZ controller function instructions are divided into two groups, the Basic function group which includes 26 commonly used function instructions and 4 SFC instructions and the advanced function group which includes other more complicated function instructions, such as high-speed counters and interrupts. This will enable the beginners and the non-experienced users to get familiar with the basic function very quickly and to assist experienced users in finding what they need in the advanced set of function instructions.

The instructions attached with “” symbol are basic functions which amounts to 26 function instructions and 4 SFC instructions. All the basic functions will be explained in next chapter. The details for the reset of functions please refer advanced manual.

■ General Timer/Counter Function Instructions

FUN No.	Name	Operand	Derivative Instruction	Function descriptions
	T nnn	PV		General timer instructions ("nnn" range 0~255)
	C nnn	PV		General counter instructions ("nnn" range 0~255)
7	UDCTR	CV,PV	D	16-Bit or 32-Bit up/down counter

■ Single Operand Function Instructions

4	DIFU	D		To get the up differentiation of a D relay and store the result to D
5	DIFD	D		To get the down differentiation of a D relay and store the result to D
10	TOGG	D		Toggle the status of the D relay

■ Setting/Resetting

	SET	D	DP	Set all bits of register or a discrete point to 1
	RST	D	DP	Clear all bits of register or a discrete point to 0
114	Z-WR	D	P	Zone set or clear

■ SFC Instructions

	STP	Snnn		STEP declaration
	STPEND			End of the STEP program
	TO	Snnn		STEP divergent instruction
	FROM	Snnn		STEP convergent instruction

■ Mathematical Operation Instructions

11	(+)	Sa,Sb,D	DP	Perform addition of Sa and Sb and then store the result to D
12	(-)	Sa,Sb,D	DP	Perform subtraction of Sa and Sb and then store the result to D
13	(*)	Sa,Sb,D	DP	Perform multiplication of Sa and Sb and then store the result to D
14	(/)	Sa,Sb,D	DP	Perform division of Sa and Sb and then store the result to D
15	(+1)	D	DP	Adds 1 to the D value
16	(-1)	D	DP	Subtracts 1 from the D value
23	DIV48	Sa,Sb,D	P	Perform 48 bits division of Sa and Sb and then store the result to D
24	SUM	S,N,D	DP	Take the sum of the successive N values beginning from S and store it in D
25	MEAN	S,N,D	DP	Take the mean average of the successive N values beginning from S and store it in D
26	SQRT	S,D	DP	Take the square root of the S value and store it in D
27	NEG	D	DP	Take the 2's complement (negative number) of the D value and store it back in D
28	ABS	D	DP	Take the absolute value of D and store it back in D
29	EXT	D	P	Take the 16 bit numerical value and extend it to 1 32 bit numerical value (value will not change)
30	PID	TS,SR,OR, PR,WR		PID operation
31	CRC	MD,S,N,D	P	CRC16 checksum calculation
32	ADCNV	PL,S,N,D		Offset and full scale conversion

FUN No.	Name	Operand	Derivative Instruction	Function descriptions
33	LCNV	Md,S,Ts,D,L	P	Linear Conversion
34	MLC	Rs,SI,Tx,Ty, TI,D	P	Multiple Linear Conversion
200	I→F	S,D	DP	Integer to floating point number conversion
201	F→I	S,D	DP	Floating point number to integer conversion
202	FADD	Sa,Sb,D	P	Addition of floating point number
203	FSUB	Sa,Sb,D	P	Subtraction of floating point number
204	FMUL	Sa,Sb,D	P	Multiplication of floating point number
205	FDIV	Sa,Sb,D	P	Division of floating point number
206	FCMP	Sa,Sb	P	Comparison of floating point number
207	FZCP	S,SU,SL	P	Zone comparison of floating point number
208	FSQR	S,D	P	Square root of floating point number
209	FSIN	S,D	P	SIN trigonometric function
210	FCOS	S,D	P	COS trigonometric function
211	FTAN	S,D	P	TAN trigonometric function
212	FNEG	D	P	Change sign of floating point number
213	FABS	D	P	Take absolute value of floating point number
214	FLN	S,D	P	Floating point napierian logarithm
215	FEXP	S,D	P	Floating point nature power function
216	FLOG	S,D	P	Floating point logarithm
217	FPOW	Sy, Sx,D	P	Floating point power function
218	FASIN	S,D	P	Floating point arc sine function
219	FACOS	S,D	P	Floating point arc cosine function
220	FATAN	S,D	P	Floating point arc tangent function

■ Logical Operation Instructions

18	AND	Sa,Sb,D	DP	Perform logical AND for Sa and Sb and store the result to D
19	OR	Sa,Sb,D	DP	Perform logical OR for Sa and Sb and store the result to D
35	XOR	Sa,Sb,D	DP	Take the result of the Exclusive OR logical operation made between Sa and Sb, and store it in D
36	XNR	Sa,Sb,D	DP	Take the result of the Exclusive OR logical operation made between Sa and Sb, and store it in D

■ Comparison Instructions

17	CMP	Sa,Sb	DP	Compare the data at Sa and data at Sb and output the result to function outputs (FO)
37	ZNCMP	S,Su,SL	DP	Compare S with the zones formed by the upper limit Su and lower limit SL, and set the result to FO0~FO2

■ In Line Comparison Instructions

FUN No.	Name	Operand	Derivative instruction	Function descriptions
170	=	Sa,Sb	D	Equal to compare
171	>	Sa,Sb	D	Greater than compare
172	<	Sa,Sb	D	Less than compare
173	<>	Sa,Sb	D	Not equal to compare
174	>=	Sa,Sb	D	Greater than or equal to compare
175	=<	Sa,Sb	D	Less than or equal to compare

■ Data Movement Instructions

8	MOV	S,D	DP	Transfer the W or DW data specified at S to D
9	MOV/	S,D	DP	Invert the W or DW data specified at S, and then transfers the result to D
40	BITRD	S,N	DP	Read the status of the bits specified by N within S, and send it to F00
41	BITWR	D,N	DP	Write the INB input status into the bits specified by N within D
42	BITMV	S,Ns,D,Nd	DP	Write the status of bit specified by N within S into the bit specified by N within D
43	NBMV	S,Ns,D,Nd	DP	Write the Ns nibble within S to the Nd nibble within D
44	BYMV	S,Ns,D,Nd	DP	Write the byte specified by Ns within S to the byte specified by Nd within D
45	XCHG	Da,Db	DP	Exchange the values of Da and Db
46	SWAP	D	P	Swap the high-byte and low-byte of D
47	UNIT	S,N,D	P	Take the nibble 0 (NB0) of the successive N words starting from S and combine the nibbles sequentially then store in D
48	DIST	S,N,D	P	De-compose the word into successive N nibbles starting from nibble 0 of S, and store them in the NB0 of the successive N words starting from D
49	BUNIT	S,N,D	P	Low byte of words re-unit
50	BDIST	S,N,D	P	Words split into multi-byte
160	RW-FR	Sa,Sb,Pr,L	DP	File register access
161	WR-MP	S, Bk,Os, Pr,L,WR		Write memory pack
162	RD- MP	Bk,Os,Pr L,D PR,WR	P	Read memory pack

■ Shifting/Rotating Instructions

FUN No.	Name	Operand	Derivative instruction	Function descriptions
6	BSHF	D	DP	Shift left or right 1 bit of D register
51	SHFL	D,N	DP	Shift left the D register N bits and move the last shifted out bits to OTB. The empty bits will be replaced by INB input bit
52	SHFR	D,N	DP	Shift right the D register N bits and move the last shifted out bits to OTB, The empty bits will be replaced by INB input bit
53	ROTL	D,N	DP	Rotate left the D operand N bits and move the last rotated out bits to OTB
54	ROTR	D,N	DP	Rotate right the D operand N bits and move the last rotated out bits to OTB

■ Code Conversion Instruction

20	→BCD	S,D	DP	Convert binary data of S into BCD data and store the result to D
21	→BIN	S,D	DP	Convert BCD data of S into binary data and store the result to D
55	B→G	S,D	DP	Binary to Gray code conversion
56	G→B	S,D	DP	Gray code to Binary conversion
57	DECOD	S,Ns,NL,D	P	Decode the binary data formed by NL bits starting from Ns bit within S, and store the result in the register starting from D
58	ENCOD	S,Ns,NL,D	P	Encoding the NL bits starting from the Ns bit within S, and store the result in D
59	→7SG	S,N,D	P	Convert the N+1 number of nibble data within S, into 7 segment code, then store in D
60	→ASC	S,D	P	Write the constant string S (max. 12 alpha-numeric or symbols) into the registers starting from D
61	→SEC	S,D	P	Convert the time data (hours, minutes, seconds) of the three successive registers starting from S into seconds data then store to D
62	→HMS	S,D	P	Convert the seconds data of S into time data (hours, minutes, seconds) and store the data in the three successive registers starting from D
63	→HEX	S,N,D	P	Convert the successive N ASCII data starting from S into hexadecimal data and store them to D
64	→ASC II	S,N,D	P	Convert the successive N hexadecimal data starting from S into ASCII codes and store them to D

■ Flow Control Instructions

FUN No.	Name	Operand	Derivative instruction	Function descriptions
0	MC	N		The start of master control loop
1	MCE	N		The end of master control loop
2	SKP	N		The start of skip loop
3	SKPE	N		The end of skip loop
	END			End of Program
22	BREAK		P	Exit from FOR-NEXT loop
65	LBL	1~6 alphanumeric		Define the label with 1~6 alphanumeric characters
66	JMP	LBL	P	Jump to LBL label and continues the program execution
67	CALL	LBL	P	Call the sub-program begin with LBL label
68	RTS			Return to the calling main program from sub-program
69	RTI			Return to interrupted main program from sub-program
70	FOR	N		Define the starting point of the FOR Loop and the loop count N
71	NEXT			Define the end of FOR loop

■ I/O Function Instructions

74	IMDIO	D,N	P	Update the I/O signal on the main unit immediately
76	TKEY	IN,D,KL	D	Convenient instruction for 10 numeric keys input
77	HKEY	IN,OT,D,KL,WR	D	Convenient instruction for 16 keys input
78	DSW	IN,OT,D	D	Convenient instruction for digital switch input
79	7SGDL	S,OT,N,WR	D	Convenient instruction for multiplexing 7-segment display
80	MUXI	IN,OT,N,D,WR		Convenient instruction for multiplexing input instruction
81	PLSO	MD,Fr,PC UY,DY,HO	D	Pulse output function (for bi-directional drive of step motor)
82	PWM	TO,TP,OT		Pulse width modulation output function
83	SPD	S,TI,D		Speed detection function
84	TDSP	MD,S,Ns, NI,D,Nd		7/16-segment LED display control
86	TPCTL	Md,Yn,Sn, Zn,Sv,Os, PR,IR,DR, OR,WR		PID Temperature control
139	HSPWM	PW,OP,RS, PN,OR,WR		Hardware PWM pulse output

■ Cumulative Timer Function Instructions

FUN No.	Name	Operand	Derivative instruction	Function descriptions
87	T.01S	CV,PV	D	Cumulative timer using 0.01s as the time base
88	T.1S	CV,PV	D	Cumulative timer using 0.1s as the time base
89	T1S	CV,PV	D	Cumulative timer using 1s as the time base

■ Watch Dog Timer Control Function Instructions

90	WDT	N	P	Set the WDT timer time out time to N ms
91	RSWDT		P	Reset the WDT timer to 0

■ High Speed Counter Control Function Instructions

92	HSCTR	CN	P	Read the current CV value of the hardware HSC, HSC0~HSC3, or HST on SoC to the corresponding CV register in the controller respectively
93	HSCTW	S,CN,D	P	Write the CV or PV register of HSC0~HSC3 or HST in the controller to CV or PV register of the hardware HSC or HST on SoC respectively

■ Report Function Instructions

94	ASCWR	MD,S,Pt		Parse and generate the report message based on the ASCII formatted data starting from the address S. Then report message will send to port1
----	-------	---------	--	---

■ Ramp Function Instructions

95	RAMP	Tn,PV,SL, SU,D		Ascending/Descending convenient instruction
98	RAMP2	Om,Ta Td,Rt Rc,WR		Tracking type ramp function for D/A output

■ Communication Function Instructions

150	M-Bus	MD,S,Pt		Modbus protocol communication
151	CLINK	Pt,MD,SR, WR		Original/Generic protocol communication

■ Table Function Instructions

FUN No.	Name	Operand	Derivative instruction	Function descriptions
100	R→T	Rs,Td,L,Pr	DP	Store the Rs value into the location pointed by the Pr in Td
101	T→R	Ts,L,Pr,Rd	DP	Store the value at the location pointed by the Pr in Ts into Rd
102	T→T	Ts,Td,L,Pr	DP	Store the value at the location pointed by the Pr in Ts into the location pointed by the Pr in Td
103	BT_M	Ts,Td,L	DP	Copy the entire contents of Ts to Td
104	T_SWP	Ta,Tb,L	DP	Swap the entire contents of Ta and Tb
105	R-T_S	Rs,Ts,L,Pr	DP	Search the table Ts to find the location with data different or equal to the value of Rs. If found store the position value into the Pr
106	T-T_C	Ta,Tb,L,Pr	DP	Compare two tables Ta and Tb to search the entry with different or same value. If found store the position value into the Pr
107	T_FIL	Rs,Td,L	DP	Fill the table Td with Rs
108	T_SHF	IW,Ts,Td, L,OW	DP	Store the result into Td after shift left or right one entry of table Ts. The shift out data is send to OW and the shift in data is from IW
109	T_ROT	Ts,Td,L	DP	Store the result into Td after shift left or right one entry of table Ts.
110	QUEUE	IW,QU,L, Pr,OW	DP	Push IW into QUEUE or get the data from the QUEUE to OW (FIFO)
111	STACK	IW,ST,L, Pr,OW	DP	Push IW into STACK or get the data from the STACK to OW (LIFO)
112	BKCMP	Rs,Ts,L,D	DP	Compare the Rs value with the upper/lower limits of L, constructed by the table Ts, then store the comparison result of each pair into the relay designated by D (DRUM)
113	SORT	S,D,L	DP	Sorting the registers starting from S length L and store the sorted result to D

■ Matrix Instructions

120	MAND	Ma,Mb,Md,L	P	Store the results of logic AND operation of Ma and Mb into Md
121	MOR	Ma,Mb,Md,L	P	Store the results of logic OR operation of Ma and Mb into Md
122	MXOR	Ma,Mb,Md,L	P	Store the results of logic Exclusive OR operation of Ma and Mb into Md
123	MXNR	Ma,Mb,Md,L	P	Store the results of logic Exclusive OR operation of Ma and Mb into Md
124	MINV	Ms,Md ,L	P	Store the results of inverse Ms into Md
125	MCMP	Ma,Mb,L Pr	P	Compare Ma and Mb to find the location with different value, then store the location into Pr
126	MBRD	Ms,L,Pr	P	Read the bit status pointed by the Pr in Ms to the OTB output
127	MBWR	Md,L,Pr	P	Write the INB input status to the bits pointed by the Pr in Ms
128	MBSHF	Ms,Md,L	P	Store the results to Md after shift one bit of the Ms. Shifted out bit will appear at OTB and the shift in bits comes from INB
129	MBROT	Ms,Md,L	P	Store the results to Md after rotate one bit of the Ms. Rotated out bit will appear at OTB.
130	MBCNT	Ms,L,D	P	Calculate the total number of bits that are 0 or 1 in Ms, then store the results into D

■ NC Positioning Instruction

FUN No.	Name	Operand	Derivative instruction	Function descriptions
140	HSPSO	Ps,SR,WR		HSPSO instruction of NC positioning control
141	MPARA	Ps,SR		Parameter setting instruction of NC positioning control
142	PSOFF	Ps	P	Stop the pulse output of NC positioning control
143	PSCNV	Ps,D	P	Convert the Ps positions of NC positioning to mm, Inch or Deg
147	MHSPO	Gp,SR,WR,		Multi-Axis high speed pulse output
148	MPG	Sc,Ps,Fo,Mr, WR		Manual pulse generator for positioning

■ Disable/Enable Control of Interrupt or Peripheral

145	EN	LBL	P	Enable HSC, HST, external INT or peripheral operation
146	DIS	LBL	P	Disable HSC, HST, external INT or peripheral operation

■ System Instruction

190	STAT	Gp, D		Read system status
-----	------	-------	--	--------------------

# Chapter 4 Sequential Instructions

The sequential instructions of WSZ-controller shown in this chapter are also listed in section 3.1. Please refer to Chapter 1, "PLC Ladder diagram", for the coding rules in applying those instructions. In this chapter, we only introduce the applicable operands, ranges and element characteristics, functionality.

## 4.1 Valid Operand of Sequential Instructions

Instruction	Operand	X	Y	M	SM	S	T	C	TR	OPEN	SHORT
	Ranges	X0   X255	Y0   Y255	M0   M1911	M1912   M2001	S0   S999	T0   T255	C0   C255	TR0   TR39	—	—
ORG		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>		<input type="radio"/>	<input type="radio"/>
ORG NOT		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>			
ORG TU		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/> *	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>			
ORG TD		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/> *	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>			
LD		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
LD NOT		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>			
LD TU		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/> *	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>			
LD TD		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/> *	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>			
AND		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>		<input type="radio"/>	<input type="radio"/>
AND NOT		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>			
AND TU		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/> *	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>			
AND TD		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/> *	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>			
OR		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>		<input type="radio"/>	<input type="radio"/>
OR NOT		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>			
OR TU		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/> *	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>			
OR TD		<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/> *	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>			
OUT			<input type="radio"/>	<input type="radio"/>	<input type="radio"/> *	<input type="radio"/>			<input type="radio"/>		
OUT NOT			<input type="radio"/>	<input type="radio"/>	<input type="radio"/> *	<input type="radio"/>					
OUT L			<input type="radio"/>								
ANDLD									—		
ORLD									—		
TU									—		
TD									—		
NOT									—		
SET			<input type="radio"/>	<input type="radio"/>	<input type="radio"/> *	<input type="radio"/>					
RST			<input type="radio"/>	<input type="radio"/>	<input type="radio"/> *	<input type="radio"/>					

※For the relays marked with a  symbol in the special relay table ( please refer to section 2.3 ) is write prohibited. In addition, TU and TD contacts are not supported for those relays as well. The operands marked with a '\*' symbol in the table shown above should exclude those special relays.

## 4.2 Element Description

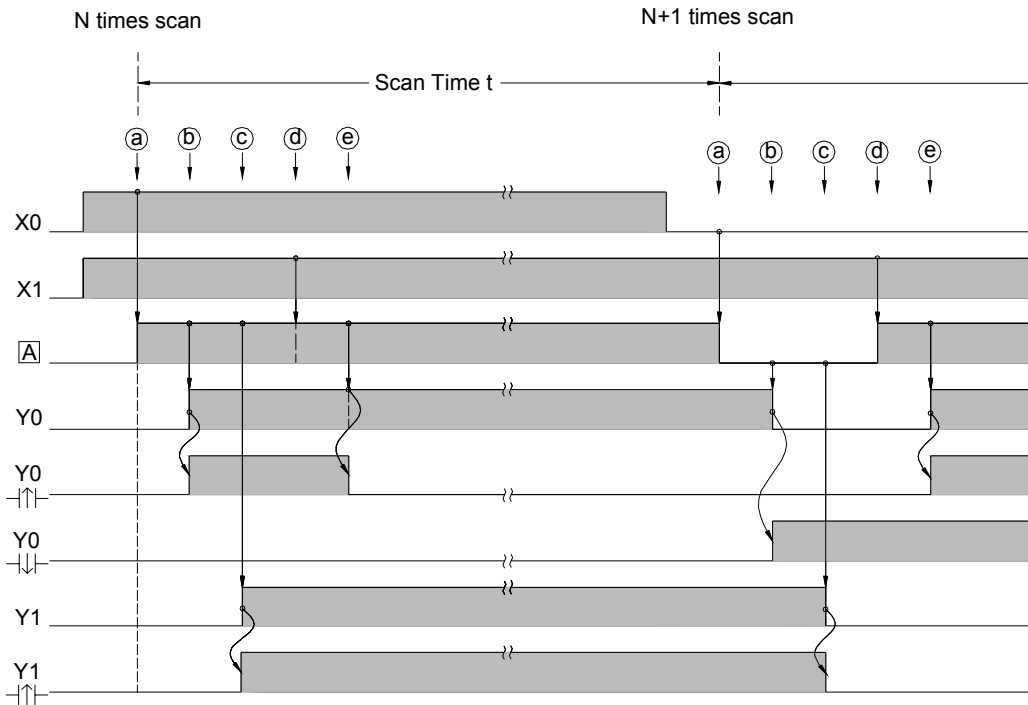

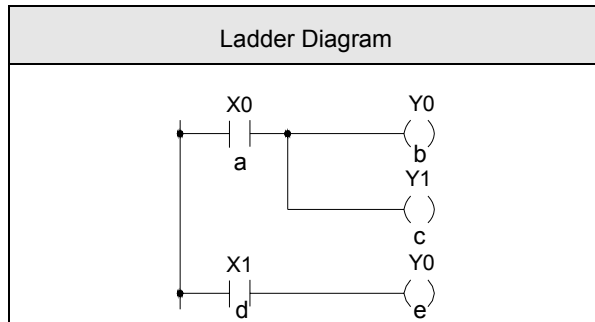

### 4.2.1 Characteristics of A,B,TU and TD Contacts

The waveform shown above reveals the function of A, B, TU and TD elements by exercising the external input X0 form OFF to ON then OFF.

- TU (Transition Up): This is the “Transition Up Contact”. Only a rising edge (0→1) of the referenced signal will turn on this element for one scan time.
- TD (Transition Down): This is the “Transition Down Contact”. Only a falling edge (1→0) of the referenced signal will turn on this element for one scan time.
- TU and TD contact will work normally as described above if the change of the status of the valid referenced operands listed in the “Valid Range of the Operand of Sequential instructions” table are not driven by the function instructions.

Remark: For TU(TD) elements which operand is of relay will turn on after the first time the corresponding relay get driven from 0 to 1(1 to 0). When the next time the corresponding relay get driven from 1 to 1(0 to 0) the TD(TU) element will turn OFF. Care should be taken while there is a multiple coil usage situation existed in the ladder program. This situation can be best illustrated at below. In the waveform we can see Y0 TU element only turn on between ① and ② time which only the Y0 TU elements existed between rung 1 and rung 2 can detect the Y0 rising edge, while other Y0 TU elements out side these two ladder rungs will never aware the occurrence of the rising edge. For the relays do not have the multiple coil usage in ladder program, The ON status of corresponding TU or TD element can be sustained for one scan time, but for relays which contrary to above, the turn on time will shorter than 1 scan time as illustrated at below.

[A]: The internal accumulator of controller

- Besides the TU/TD instructions which can detect the status change of reference operand, WSZ-controller also provides the instructions to detect the change of node status (power flow). For details please refer the descriptions of FUN4 (DIFU) and FUN5 (DIFD) instructions at chapter 6.

#### 4.2.2 OPEN and SHORT Contact

The status of OPEN and SHORT contact are fixed and can't be changed by any ladder instructions. Those two contacts are mainly used in the places of the Ladder Diagram where fixed contact statuses are required, such as the place where the input of an application instruction is used to select the mode. The sample program shown below gives an example of configuring an Up/Down counter (UDCTR) to an Up counter by using the SHORT contact.

FUN7 is the UDCTR function. While rising edge of CK input occur, FUN7 will count up if the U/D status is 1 or count down if the U/D status is 0. The example shown above, U/D status is fixed at 1 since U/D is directly connected from the origin-line to a SHORT contact, therefore FUN7 becomes an Up counter. On the contrary, if the U/D input of FUN7 is connected with an OPEN contact from the origin-line, the FUN7 becomes a DOWN counter.

### 4.2.3 Output Coil and Inverse Output Coil

Output Coil writes the node status into an operand specified by the coil instruction. Invert Output Coil writes the complement status of node status into an operand specified by the coil instruction. The characteristics depicts at below.

### 4.2.4 Retentive Output Coil

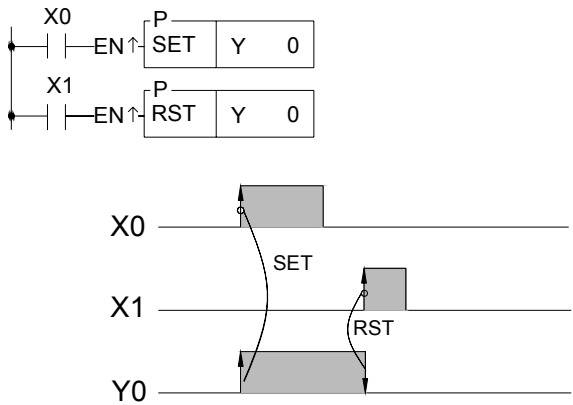

The coil element can be categorized into two types, namely Retentive and Non Retentive. For example, M0~M799 can be specified as the Retentive coils and M800~M1399 can be specified as the Non Retentive coils. One way to categorize the relay type is to divide the relays into groups. Though this method is simple but for the most applications the coils needed to be retentive may be in a random order.

From the above example, if turn the X0 "ON" then "OFF", Y0 will keep at "ON". When change the controller state from RUN to STOP then RUN or turn the power off then on, the Y0 still keep at ON state. But if use the OUT Y0 instruction instead of the OUT L Y0 , Y0 status will be OFF.

### 4.2.5 Set Coil and Reset Coil

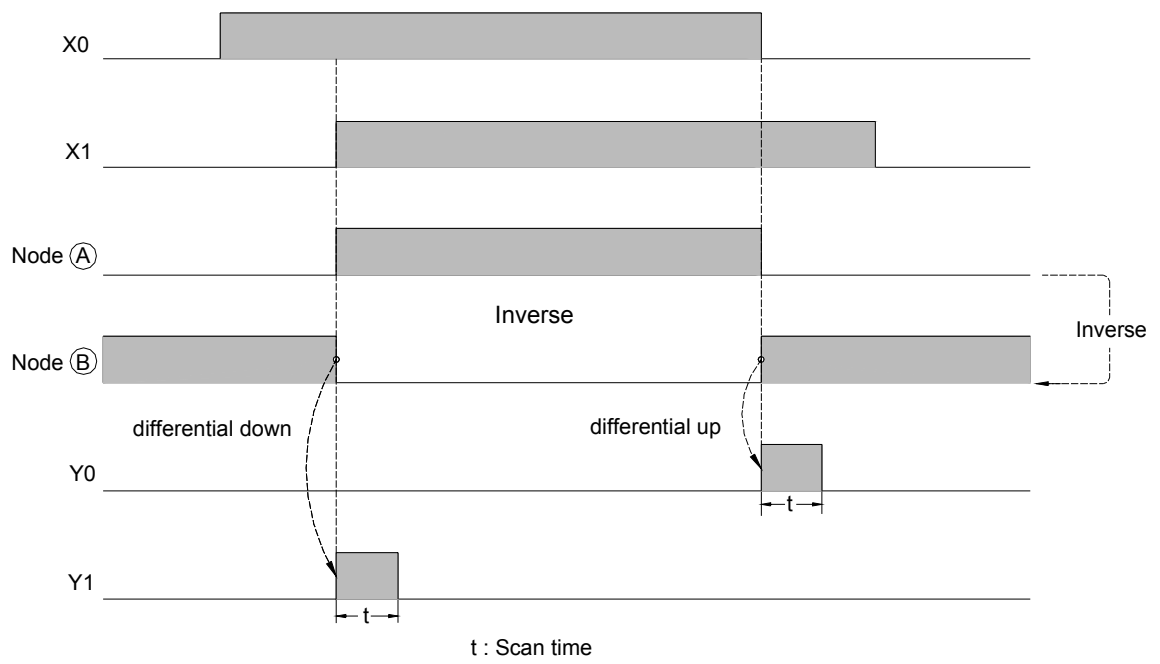

Set Coil writes 1 into an operand specified. Reset Coil writes 0 into an operand specified. The characteristics depicts at below.

### 4.3 Node Operation Instructions

A node is the connection between elements in a ladder diagram consisting of sequential instruction elements (please refer to Section 1.2). There are four instructions dedicated for node status operation in WSZ-controller. Using the diagram below, the three node operation instructions NOT, TU and TD, are illustrated.

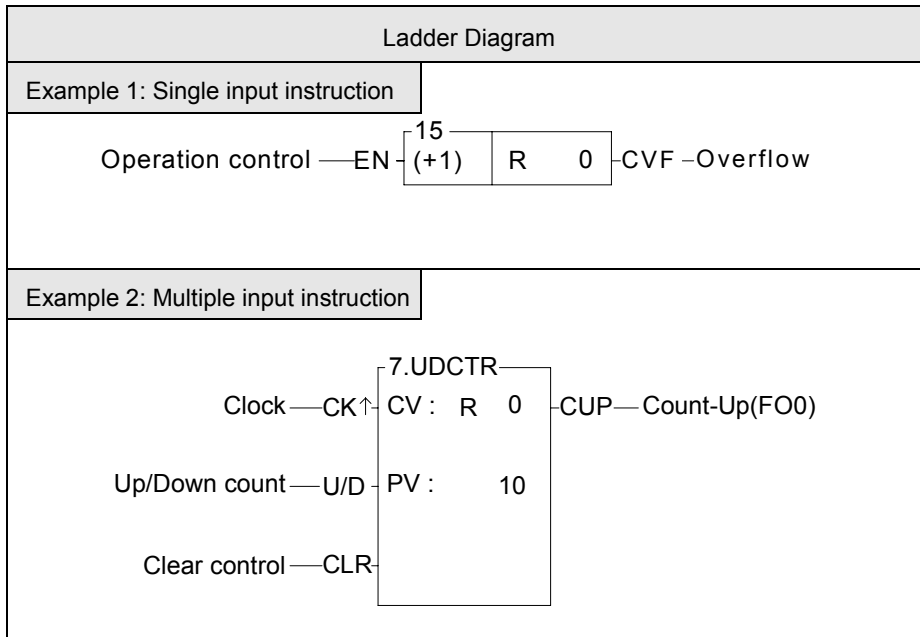

# Chapter 5 Descriptions of Function Instructions

## 5.1 The Format of Function Instructions

In this chapter we will introduce the function instructions of WSZ-controller in details. All the explanations for each function will be divided into four parts including input control, instruction number/name, operand and function output. An example is shown in below.

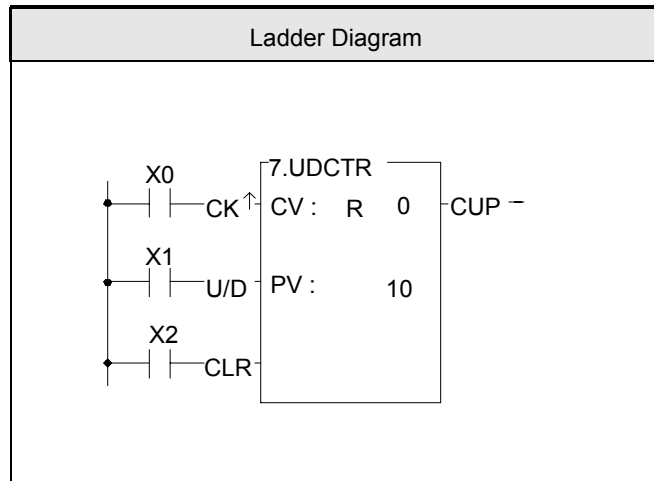

### 5.1.1 Input Control

Except for the seven function instructions that do not have input control, the number of the input control of other WSZ-controller function instructions can be ranged from one to four. Execution of the instructions and operations is dependent on the input control signal or the combinations of the several input control signals. The ladder programming software for WSZ controller - WinProladder can help user to complete the complex design and document works. In the ladder program window we can see all the function instructions were displayed by blocks surrounded with abbreviated words for ease of comprehension, include inputs, outs, function name, and parameter names. As shown in example 2 above, the first input mark "CK ↑" indicates when the "CK ↑" input changes from 0 to 1 (rising edge) the counter will be increased or decreased by 1 (depending on the "U/D" status). The second input mark "U/D" with a status of 1 represents the word above slash ("U") and the status 0 represents the word under slash ("D"), that is second input "U/D" states =1, the counter will be increased by 1 when "CK ↑" input from 0 to 1, and when "U/D"=0, the counter will be decreased by 1. The third input mark "CLR" indicates when this input is 1, the counter will be cleared to 0. Chapter 6~7 give the descriptions of input control of each function instruction.

Remark: There are total of seven instructions whose input control should be directly connected to the origin-line those are MCE, SKPE, LBL, RTS, RTI, FOR, and NEXT. Please refer to chapter 6 and 7 for more detailed explanations.

All input controls of the function instructions should be connected by the corresponding elements, otherwise a syntax error will occur. As shown in example 3 below, the function instruction FUN7 has three inputs and three elements before FUN7. ORG X0, LD X1 and LD X2 corresponds to the first input CK ↑, second input U/D and third input CLR.

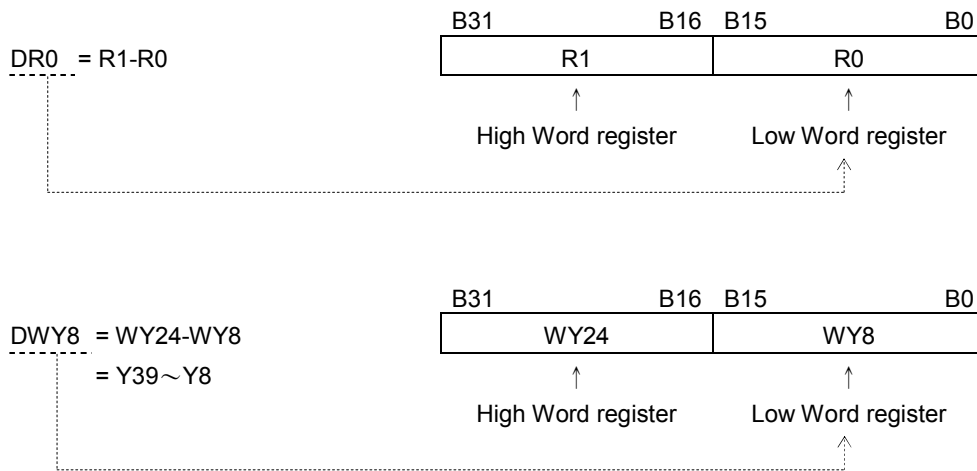

Example 3:

### 5.1.2 Instruction Number and Derivative Instructions

As mentioned before, except for the nine instructions that can be entered using the dedicated keys on the keyboard, other function instructions must be entered using the "instruction number". Follow the instruction number there are postfixes D, P, DP can be added which can derive three additional function instructions.

D: Indicates a Double Word (32-bit). The 16-bit word is the basic unit of the registers in WSZ-controller. The data length of R, T and C (except C200~C255) registers are 16-bit. If a register with 32-bit data length is required, then it is necessary to combine two consecutive 16-bit registers together such as R1-R0, R3-R2 etc. and those registers are represented by prefix a D letter before register name such as DR0 represents R1-R0 and DR2 represents R3-R2.

Remark: In order to differentiate between 16-bit and 32-bit instructions while using the ladder diagram, we add the postfix letter D after the "Instruction number" to represent 32-bit instructions and the size of their operand are 32-bit as shown in example 2 on P.6-6. The instruction FUN 11D has a postfix letter D, therefore the source and destination operands need to prefix a letter D as well, such as the augend Sa : R0 is actually Sa=DR0=R1-R0 and Sb=DR2=R3-R2. Please also pay special attention to the length of the other operands except source and destination are only one word whether 16-bit or 32-bit instructions are used.

P: indicates the pulse mode instruction. The instruction will be executed when the status of input control changes from 0 to 1 (rising edge). As shown in example 1, if a postfix letter P is added to the instruction (FUN 15P), the instruction FUN 15P will only be executed when the status of input control signal changes from 0 to 1. The execution of the instruction is in level mode if it does not have a P postfix, this means the instruction will be executed for every scan until the status of input control changes from 1 to 0. The pulse input is indicated by a symbol "↑", such as CK ↑, EN ↑, TG ↑ etc.. In this operation manual, an example of the operation statement of a function instruction is shown below.

● When the operation control "EN" =1 or "EN ↑" (P instruction) from 0→1, .....

The first one indicates the execution requirement for non-P instruction (level mode) and the second one indicates the execution requirement for P instruction (pulse mode). The following waveform shows the result (R0) of FUN15 and FUN15P under the same input condition.

DP: Indicates the instruction is a 32-bit instruction operating with pulse mode.

Remark: P instruction is much more time saving than level instruction in program scanning, So user should use P instruction as much as possible.

### 5.1.3 Operand

The operand is used for data reference and storage. The data of source (S) operand are only for reference and will not be changed with the execution of the instruction. The destination (D) operand is used to store the result of operation and its data may be changed after the execution of the instruction. The following table illustrates the names and functions of WSZ controller function instruction's operands and types of contacts, coils, or registers that can be used as an operand.

■ The names and functions of the major operands:

Abbreviation	Name	Descriptions
S	Source	The data of source (S) operand are only for reading and reference and will not be changed with the execution of the instruction. If there are more than one source operands, each operand will be identified by the footnote such as Sa and Sb.

Abbreviation	Name	Descriptions
D	Destination	The destination (D) operand is used to store the result of operation. The original data will be changed after operation. Only the coils and registers which are not writing prohibited can be the destination operand.
L	Length	Indicates the data size or the length of the table, usually are constants.
N	Number	A constant most often used as numbers and times. If there are more than one constant, each constant will be identified by the footnotes such as Na, Nb, Ns etc..
Pr	Pointer	Used to point to a specific a block of data or a specific data or register in a table. Generally the Pr value can be varied, therefore cannot be constant or input register. )
CV	Current value	Used in T and C instruction to store the current value of T or C
PV	Set value	Used in T and C instructions for reference and comparison
T	Table	A combination of a set of consecutive registers forms a table. The basic operation units are word and double word. If there is more than one table, each table will be identified by footnotes such as Ta, Tb, Ts and Td etc...
M	Matrix	A combination of a set of consecutive registers forms a matrix. The basic operation unit is bit. If there is more than one matrix, each matrix will be identified by footnotes such as Ma, Mb, Ms and Md etc...

Besides the major operands mentioned above, there are other operands which are used for certain special purposes such as the operand Fr for frequency, ST for stack, QU for Queue etc.. Please refer to the instruction descriptions for more details.

- The types of the operand and their range: The types of operand for the function instructions are discrete, register and constant.

a) Discrete operand:

There are total five function instructions that reference the discrete operand, namely SET, RST, DIFU, DIFD and TOGG. Those five instructions can only be used for operations of Y△△△(external output), M△△△△ (internal and special) and S△△△(step) relays. The table shown below indicates the operands and ranges of the five function instructions.

Range	Y	M	SM	S
Oper- rand	Y0   Y255	M0   M1911	M1912   M2001	S0   S999
D	○	○	○*	○

Symbol "O" indicates the D (Destination operand) can use this type of coils as operands. The "\*" sign above the "O" shown in SM column indicates that should exclude the write prohibited relays as operands. Please refer to page 2-3 for introduction of the special relays.

b) Register operand :

The major operand for function instructions is register operand. There are two types of register operands: the native registers which already is of Words or Double Words data such as R, D, T, C. The other is derivative registers (WX, WY, WM, WS) which are formed by discrete bits. The types of registers that can be used as instruction operands and their ranges are all listed in the following table:

Range	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
Oper- and	WX0	WY0	WM0	WS0	T0	C0	R0	R3840	R3904	R3968	R5000	D0	16/32-bit +/- number	V、Z P0~P9
	WX240	WY240	WM1896	WS984	T255	C255	R3839	R3903	R3967	R4167	R8071	D4095		
S	○	○	○	○	○	○	○	○	○	○	○*	○	○	○
D		○	○	○	○	○	○		○	○*	○*	○		○
⋮														

The "○" symbol in the table indicates can apply this kind of data as operand. The "○\*" symbol indicates can apply this kind of data except the write prohibited registers as operand. To learn more about write prohibited registers please refer to page 2-8 for introduction of the special register.

When R5000~R8071 are not set to be read only registers, can used as normal registers (read, and write)

Remark 1: The registers with a prefix W, such as WX, WY, WM and WS are formed by 16 bits. For example, WX0 means the register is formed by X0(bit 0)~X15(bit 15). WY144 means the register is formed by Y144(bit 0)~Y159(bit 15). Please note that the discrete number must be the multiple of 8 such as 0, 8, 16, 24....

Remark 2: The last register (Word) in a table can not be represented as a 32-bit operand in the function because 2 Words are required for a 32-bit operand.

Remark 3: TMR ( T0 ~ T255 ) and CTR ( C0 ~ C255 ) are the registers of timers and counters respectively. Although they can be used as general registers, they also complicate the systems and make debugging more difficult. Therefore you should avoid writing anything into the TMR or CTR registers.

Remark 4: T0 ~ T255 and C0 ~ C199 are 16-bit register. But C200~C255 are 32-bit register, therefore can't be used as 16-bit operands.

Remark 5: Apart from being directly appointed by register's number (address) as the foregoing discussions, the register's operand in the range of R0 ~ R8071 can be combined with pointer register V、Z or P0~P9 to make indirect addressing. Please refer to the example in the next section (Section 5.2) for the description of using pointer register (XR) to make indirect addressing.

c) Constant operands :

The range of 16-bit constant is between -32768~32767. The range of 32-bit constant is between -2147483648~2147483647. The constant for several function instructions can only be a positive constant. The ranges of 16-bit and 32-bit constants are listed in the table shown below.

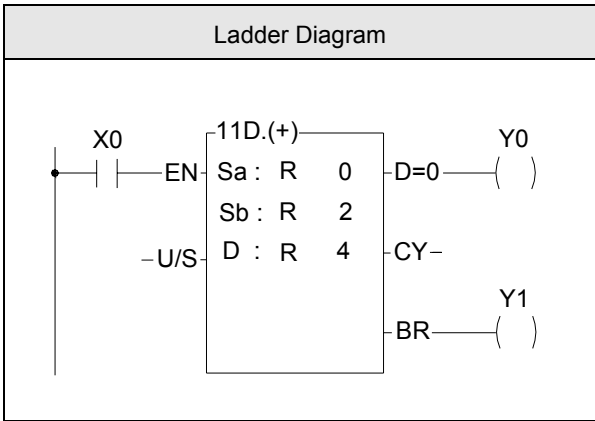

Classification	Range
16-bit signed number	-32768~32767
16-bit un-signed number	0~32767
32-bit signed number	-2147483648~2147483647
32-bit un-signed number	0~2147483647
16/32-bit signed number	-32768~32767 or -2147483648~2147483647
16/32-bit un-signed number	0~32767 or 0~2147483647

It is possible that the length and size of a specific operand, such as L, bit size, N etc..., are different, and the differences are all directly marked at the operand column. Please refer to the explanations of function instructions.

### 5.1.4 Functions Output (FO)

The “Function Output” (FO) is used to indicate the operation result of the function instruction. Like control input, each function outputs shown in the screen of programming software are all attached with a word which comes from the abbreviation of the output functionality. Such as CY derived from Carry. The maximum number of function outputs is 4 and those are denoted as FO0, FO1, FO2, FO3 respectively. The FO status must be taken out by FO instruction. The unused FO may be left without connecting to any elements, such as FO1 (CY) shown in Example 4 below.

Example 4 :

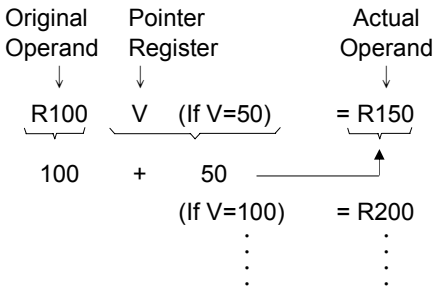

When M1919=0, the FO status will only be updated if the instruction is executed. It will keep the same status until a new FO status is generated after the instruction is executed again (memory keeping).

When M1919=1, the FO status will be reset to 0 (no memory keeping) if the instruction is not executed.

### 5.2 Use Index Register (XR) for Indirect Addressing

In the WSZ-controller function instructions, there are some operands that can be combined with pointer register (V · Z · P0~P9) to make indirect addressing (will be shown in the operand table if it applicable). However, only the registers in the range R0~R8071 can be combined with an pointer register to perform indirect addressing (other operands such as discrete, constant and D0~D3071 cannot be used for indirect addressing).

There are twelve pointer registers XR (V · Z · P0~P9). The V register in fact is the R4164 of special registers (R3840~R4167) , the Z register is the R4165 and the P0~P9 register is the (D4080~D4089). The actual addressed register by index addressing is just offset the original operand with the content of the index register.

As shown in the above diagram, you only need to change the V value to change the operand address. After combining the index addressing with the WSZ-controller function instructions, a powerful and highly efficient control application can be achieved by using very simple instructions. Using the program shown in the diagram below as an example, you only need to use a block move instruction (BT\_M) to achieve a dynamic block data display, such as a parking management system.

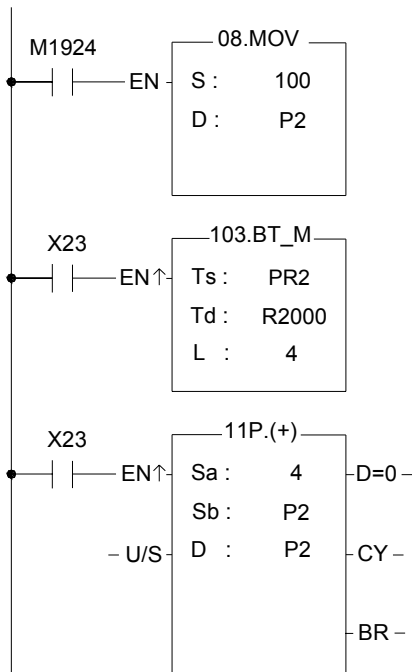

**Index Register(P0~P9) Introduction**

In indirect addressing application, Rxxxx register can combine V · Z & P0~P9 for index addressing; Dxxxx register can't combine V · Z for index addressing, but P0~P9 are allowed.

When V · Z index register being combined with the Rxxxx register,  
 for example, R0 with V · Z, the instruction format is R0V(where V=100, it means R100) or R0Z(where Z=500, it means R500); when P0~P9 index register being combined with the Rxxxx register, the instruction format is RPn (n=0~9) or RPsPn (m,n=0~9), for example RP5 (where P5=100, it means R100) or RP0P1(where P0= 100, P1=50, it means150).

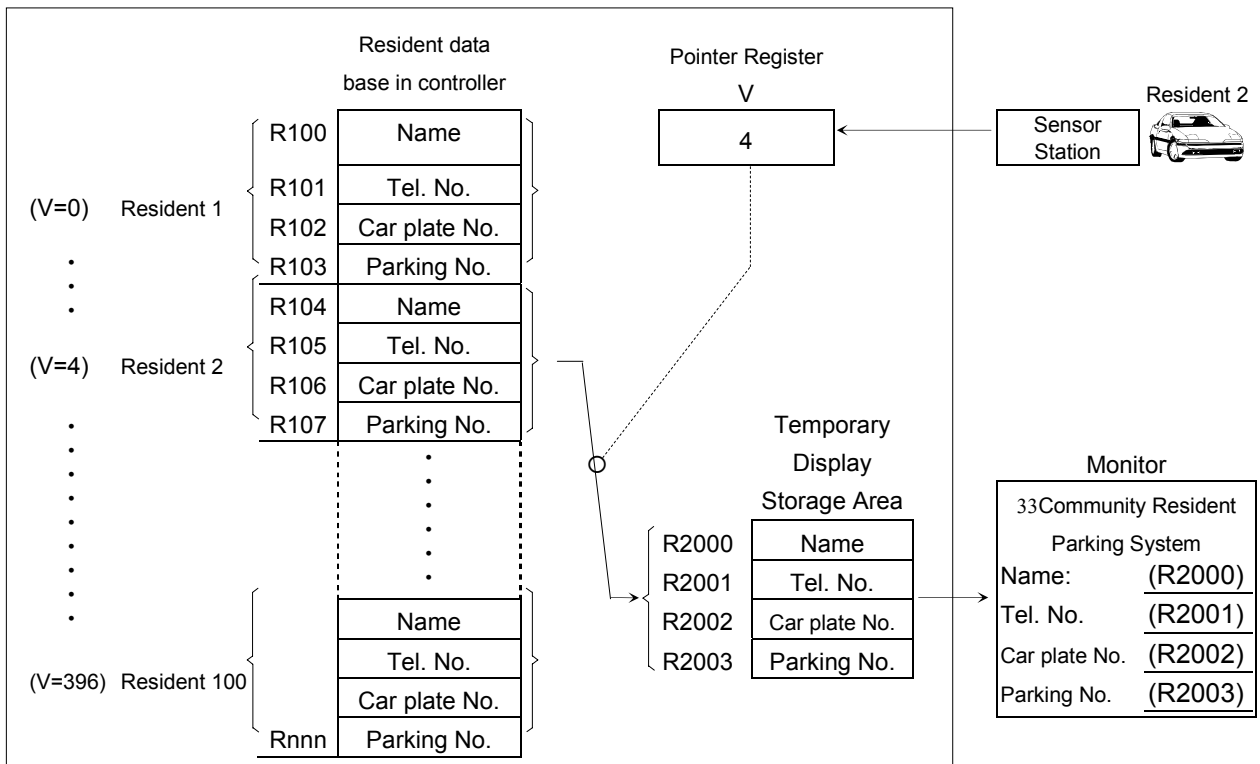

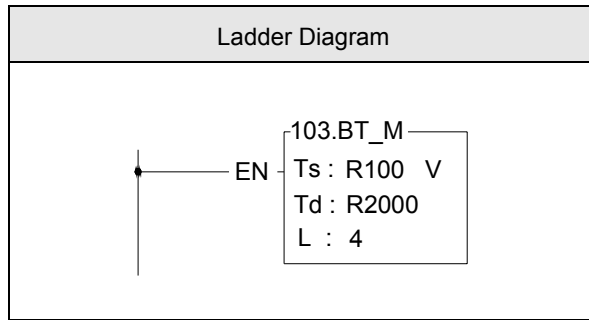

When P0~P9 index register being combined with the Dxxxx register, the instruction format is DPn (n=0~9) or DPmPn (m,n=0~9), for example DP3 (where P3=10, it means D10) or DP4P5 (where P4=100, P5=1, it means D101).

It can combine both P0~P9 index register, for example P2=20, P3=30, when Rxxxx or Dxxxx register combines both index register, RP2P3 will point to R50, DP2P3 will point to D50, it means the summation of both index register for indirect addressing.

1. Index register P2=100 while power up or first run.
2. When X23 changes from 0→1, FUN103 will perform the table movement, the source starts from R100 (P2=100), the destination starts from R2000, the amount is 4. Coping the content of R100~R103 for R2000~R2003 at first execution, coping the content of R104~R107 for R2000~R2003 at second execution...
3. Increasing the P2 index register by 4 to point to next 4.

**Indirect addressing program example**

**Description**

Suppose that there are 100 resident parking spaces available in a parking management system for community residents. Each resident has a set of basic information including name, telephone number, number plate and parking number, that occupy four consecutive controller registers as shown in the above diagram. A total of 400 registers (R100~R499) are occupied. Each resident is given a card with a unique card number (the number is 0 for resident 1, 4 for resident 2 etc.. ) for the sensing pass of the main entrance and parking lot. The card number will be sensed by the controller and stored into the pointer register "V". The attendant's monitor (LCD or CRT) will only display the data grasped by R2000~R2003 in the controller. For example, the card of residence 2 with the card number 4 is sensed, then the register V=4 and the controller will immediately move the data in R104~R107 to the temporary display storage area (R2000~R2003). Hence, the attendant's monitor can display the data of residence 2 as soon as its card is sensed.

## Warning

1. Although using pointer register for indirect addressing application is powerful and flexible, but changing the V and Z values freely and carelessly may cause great damages with erroneous writing to the normal data areas. The user should take special caution during operation.
2. In the data register range that can be used for indirect addressing application (R0~R8071), the 328 registers R3840~R4167 (i.e. IR, OR and SR) are important registers reserved for system or I/O usage. Writing at-will to these registers may cause system or I/O errors and may result in a major disaster. Due to the fact that users may not easily detect or control the flexible register address changes made by the V and Z values, WSZ-controller will automatically check if the destination address is in the R3840~R4067 range. If it is, the write operation will not be executed and the M1969 flag "Illegal write of Indirect addressing" will be set as 1. In case it is necessary to write to the registers R3840~R4067, please use the direct addressing.

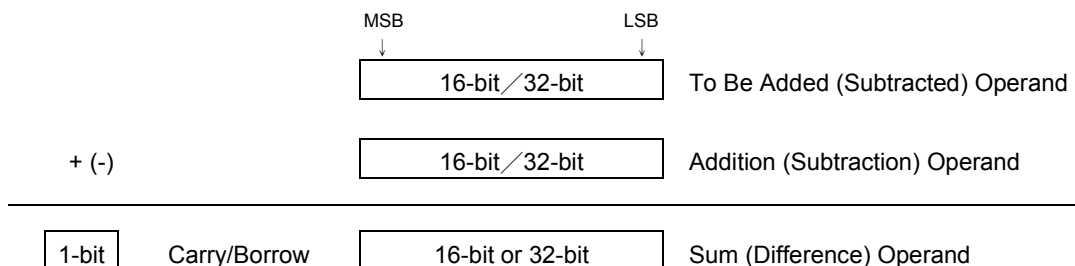

### 5.3 Overflow and Underflow of Increment (+1) or Decrement (-1) (Beginners should skip this section)

The maximum positive values that can be represented by 16-bit and 32-bit operands are 32767 and 2147483647, respectively. While the minimum negative values that can be represented by 16-bit and 32-bit operands are -32768 and -2147483648, respectively. When increase or decrease an operand (e.g. when Up/Down Count of a counter or the register value is +1 or -1), and the result exceeds the value of the positive limit of the operand, then "Overflow" (OVF) occurs. This will cause the value to cycle to its negative limit (e.g. add 1 to the 16-bit positive limit 32767 will change it to -32768). If the result is smaller than the negative limit of the operand, then "Underflow" (UDF) occurs. This will cause the value to cycle to its positive limit (e.g. deducting 1 from the negative limit -32768 will change it to 32767) as shown in the table below. The flag output of overflow or underflow exists in the FO of WSZ-controller and can be used in cascaded instructions to obtain over 16-bit or 32-bit operation results.

Increase (Decrease) Result Overflow/ Underflow	16-bit Operand	32-bit Operand
Increase	OVF=1 <div style="display: flex; align-items: center; justify-content: center;"> <div style="margin-right: 10px;">{</div> <div style="text-align: left;">           -32767            -32768            32767            32766            32765         </div> </div>	OVF=1 <div style="display: flex; align-items: center; justify-content: center;"> <div style="margin-right: 10px;">{</div> <div style="text-align: left;">           -2147483646            -2147483647            -2147483648            2147483647            2147483646         </div> </div>
Decrease	UDF=1 <div style="display: flex; align-items: center; justify-content: center;"> <div style="margin-right: 10px;">{</div> <div style="text-align: left;">           -32767            -32768            32767            32766            32765         </div> </div>	UDF=1 <div style="display: flex; align-items: center; justify-content: center;"> <div style="margin-right: 10px;">{</div> <div style="text-align: left;">           -2147483647            -2147483648            2147483647            2147483646            2147483645         </div> </div>

### 5.4 Carry and Borrow in Addition/Subtraction

Overflow/Underflow takes place when the operation of increment/decrement causes the value of the operand to exceed the positive/negative limit that can be represented in the controller; consequently a flag of overflow/underflow is introduced. Carry/Borrow flag is different from overflow/underflow. At first, there must be two operands making addition (subtraction) where a sum (difference) and a flag of carry/borrow will be obtained. Since the number of bits of the numbers to be added (subtracted), to add (subtract) and of sum (difference) are the same (either 16-bit or 32-bit), the result of addition (subtraction) may cause the value of sum (difference) to exceed 16-bit or 32-bit. Therefore, it is necessary to use carry/borrow flag to be in coordination with the sum (difference) operand to represent the actual value. The carry flag is set when the addition (subtraction) result exceeds the positive limit (32767 or 2147483647) of the sum (difference) operand. The borrow flag is set when addition (subtraction) result exceeds the negative limit (-32768 or -2147483648) of the sum (difference) operand. Hence, the actual result after addition (subtraction) is equal to the carry/borrow plus the value of the sum (difference) operand. The FO of WSZ controller addition/subtraction instructions has both carry and borrow flag outputs for obtaining the actual result.

While all WSZ-controller numerical operations use 2'S Complement, the representation of the negative value of the sum (difference) obtained from addition (subtraction) is different from the usual negative number representation. When the operation result is a negative value, 0 can never appear in the MSB of the sum (difference) operand. The carry flag represents the positive value 32768 (2147483648) and the borrow flag represents the negative value -32768 (-2147483648).

Basic Function Instruction

T	TIMER	T
---	-------	---

Symbol	
--------	--

Tn: Timer Number.  
PV: Preset value of the timer.

Operand

Range	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K
Operand	WX0   WX240	WY0   WY240	WM0   WM1896	WS0   WS984	T0   T255	C0   C255	R0   R3839	R3840   R3903	R3904   R3967	R3968   R4167	R5000   R8071	D0   D4095	0   32767
Tn					○								
PV	○	○	○	○	○	○	○	○	○	○	○	○	○

- The total number of timers is 256 (T0~T255) with three different time bases, 0.01s, 0.1s and 1s. The default number and allocation of timers is shown as below (Can be adjusted according to user's actual requirements by the "Configuration" function):
  - T0~T49 : 0.01s timer ( default as 0.00~327.67s )
  - T50~T199 : 0.1s timer ( default as 0.0~3276.7s )
  - T200~T255 : 1s timer ( default as 0~32767s )
- WSZ programming tool will lookup the timer's time base automatically according to the "Memory Configuration" after the timer number is keyed in. Timer's time = Time base x Preset value. In the example 1 below, the time base T0 = 0.01s and the PV value = 1000, therefore the T0 timer's time = 0.01s x 1000 = 10.00s.
- If PV is a register, then Timer's time = Time base x register content. Therefore, you only need to change the register content to change the timer's time. Please refer to Example 2.
- ※ The maximum error of a timer is a time base plus a scan time. In order to reduce the timing error in the application, please use the timer with a smaller time base.

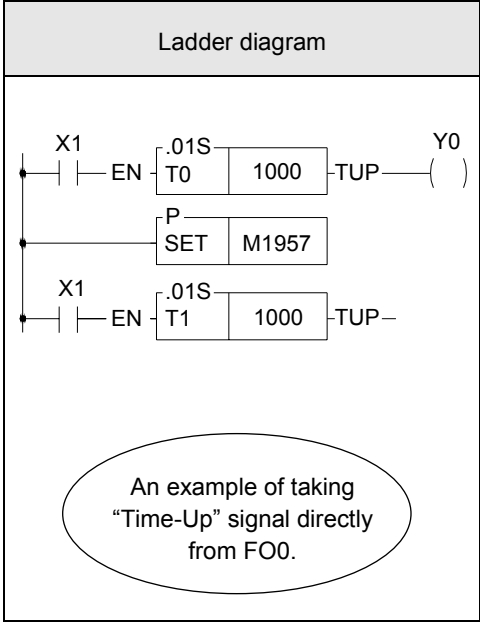

Description	
-------------	--

- When the time control "EN" is 1, the timer will start timing (the current value will accumulate from 0) until "Time Up" (i.e. CV ≥ PV), then the Tn contact and TUP (FO0) will change to 1. As long as the timer control "EN" input is kept as 1, even the CV of Tn has reached or exceeded the PV, the CV of the timer will continue accumulating (with M1957 = 0) until it reaches the maximum limit (32767). The Tn contact status and flag will remain as 1 when CV ≥ PV, unless the "EN" input is 0. When "EN" input is 0, the CV of Tn will be reset to 0 immediately and the Tn contact and "Time Up" flag TUP will also change to 0 (please refer to the diagram ① below).
- If the WSZ OS version is higher than V3.0 (inclusive), the M1957 can be set to 1 so the CV will not accumulate further after "Time Up" and stops at the PV value. The default value of the M1957 is 0, therefore the status of M1957 can be set before executing any timer instruction in the program to individually set the timer CV to continue accumulating or stop at the PV after "Time Up" (please refer to the diagram ② below).

T	TIMER	T
---	-------	---

Example 1

Constant preset value

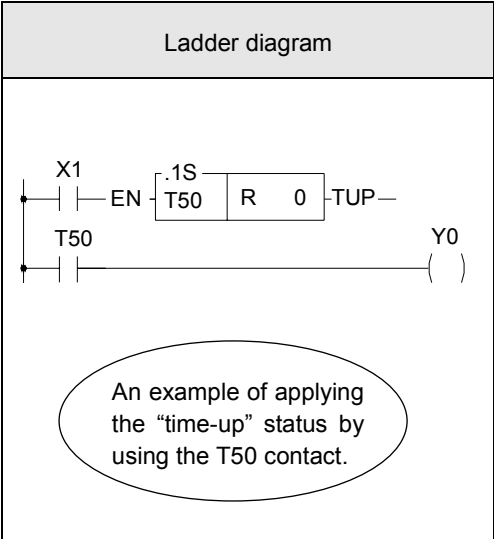

Example 2

Variable PV

The preset value (PV) shown in example 1 is a constant which is equal to 1000. This value is fixed and can not be changed once programmed. In many circumstances, the preset time of the timers needs to be varied while controller running. In order to change the preset time of a timer, can first use a register as the PV operand (R or WX, WY...) and then the preset time can be varied by changing the register content. As shown in this example, if set R0 to 100, then T becomes a 10s Timer, and hence if set R0 to 200, then T becomes a 20s Timer.

Basic Function Instruction

T	TIMER	T
---	-------	---

**Remark:** If the preset value of the timer is equal to 0, then the timer's contact status and FO0 (TUP) become 1 ("EN" input must be at 1) immediately after the controller finishes its first scan because "Time-Up" has occurred. (TUP) stays at 1 until "EN" input changes to 0.

C	<b>COUNTER</b> ( 16-Bit: C0~C199 · 32-Bit: C200~C255 )	C
---	---	---

Symbol	
--------	--

Range	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K
Ope- rand	WX0	WY0	WM0	WS0	T0	C0	R0	R3840	R3904	R3968	R5000	D0	0
	WX240	WY240	WM1896	WS984	T255	C255	R3839	R3903	R3967	R4167	R8071	D4095	2147483647
Cn						○							
PV	○	○	○	○	○	○	○	○	○	○	○	○	○

- There are total 200 16-Bit counters (C0~C199). The range of preset value is between 0~32767. C0~C139 are Retentive Counters and the CV value will be retained when the controller turns on or RUN again after a power failure or a controller STOP. For Non Retentive Counters, if a power failure or controller STOP occurs, the CV value will be reset to 0 when the controller turns on or RUN again.
- There are total 56 32-Bit counters (C200~C255). The range of the preset value is between 0~2147483647. C200~C239 are Retentive Counters and C240~C255 are Non Retentive Counters.
- The default number and assignment of the counters are shown below, if necessary can use the "CONFIGURATION" function to change the settings.
- To insure the proper counting, the sustain time of input status of PLS should greater than 1 scan time.
- The max. counting frequency with this instruction can only up to 20Hz, for higher frequency please use the high-speed soft/hardware counter.

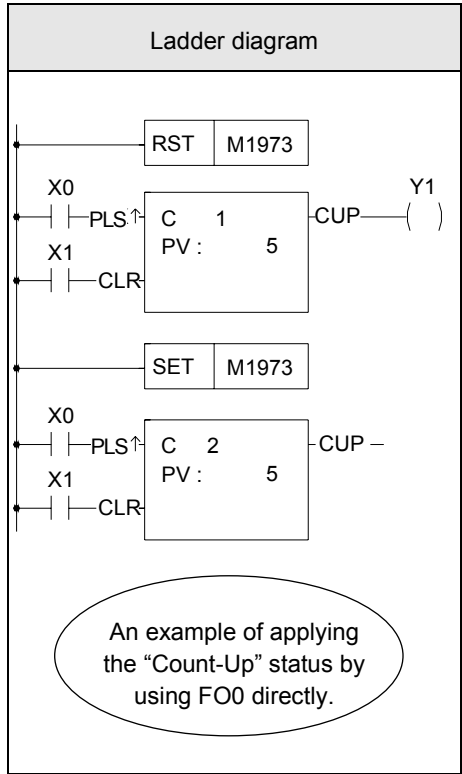

Description	
-------------	--

- When "CLR" is at 1, all of the contact Cn, FO0 (CUP), and CV value of the counter CV are cleared to 0 and the counter stops counting.
- When "CLR" is at 0, the counter is allowed to count up. The Counter counts up every time the clock "PLS" changes from 0 to 1 (adds 1 to the CV) until the cumulative current value is equal to or greater than the preset value (CV>=PV), the counter "Count-Up" and the contact status of the counter Cn and FO0 (CUP) changes to 1. If the input status of clock continues to change, even the cumulative current value is equal and greater than the preset value, the CV value will still accumulate until it reaches the up limit at 32767 or 2147483647. The contact Cn and FO0 (CUP) stay at 1 as long as CV>=PV unless the "CLR" input is set to 1. ( please refer the diagram ① below )
- If the WSZ OS version is higher than V3.0 (inclusive), the M1973 can set to 1 so the CV will not accumulate further after "Count Up" and stops at the PV. M1973 default value is 0, therefore the status of M1973 can be set before executing any counter instruction in the program to individually set the counter CV to continue accumulating or stops at the PV after "Count Up" (please refer to the diagram ② below).

Basic Function Instruction

C	<b>COUNTER</b> ( 16-Bit: C0~C199, 32-bit: C200~C255 )	C
---	--	---

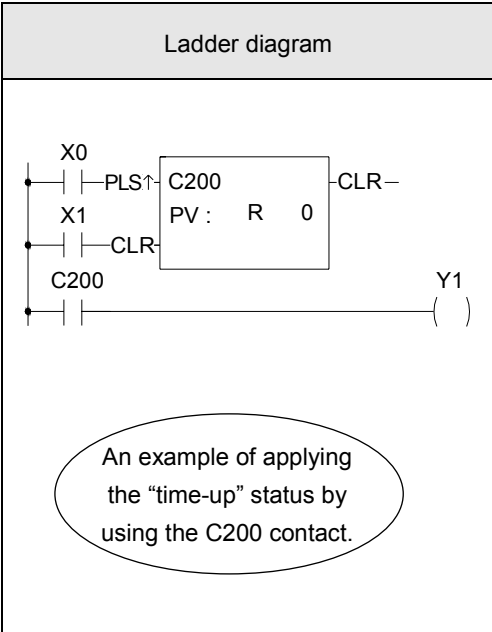

Example 1	16-Bit Fixed Counter
-----------	----------------------

Example 2	32-Bit counter with variable preset value
-----------	---

Like a timer, if the PV of a counter is changed to a register (such as R, D, and so on), the counter will use the register contents as the counting PV. Therefore, only need to change the register contents to change the PV of the counter while controller is running. Below is an example of a 32-bit counter that uses the data register R0 as the PV (in fact it is the 32-bit PV formed by R1 and R0).

C	<b>COUNTER</b> ( 16-Bit: C0~C199, 32-Bit: C200~C255 )	C
---	--	---

**Remark:** If the preset value of the counter is 0 and "CLR" input also at 0, then the Cn contact status and FO0 (CUP) becomes 1 immediately after the controller finishes its first scan because the "Count-Up" has occurred. It will stay at 1 regardless how the CV value varies until "CLR" input changes to 1.

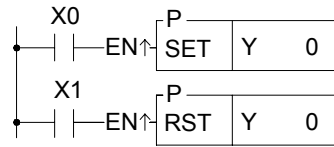

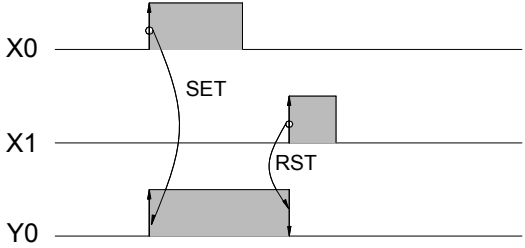

Basic Function Instruction

Basic Function Instruction

FUN 0 MC	MASTER CONTROL LOOP START	FUN 0 MC
Symbol	<div style="display: flex; justify-content: space-between;"> <div style="text-align: center;"> <p><u>Ladder symbol</u></p>  </div> <div style="text-align: center;"> <p><u>Operand</u></p> <p>N: Master Control Loop number (N=0~127) the number N cannot be used repeatedly.</p> </div> </div>	
Description	<ul style="list-style-type: none"> <li>● There are a total of 128 MC loops (N=0~127). Every Master Control Start instruction, MC N, must correspond to a Master Control End instruction, MCE N, which has the same loop number as MC N. They must always be used in pairs and you should also make sure that the MCE N instruction is after the MC N instruction.</li> <li>● When the Master Control input "EN/" is 1, then this MC N instruction will not be executed, as it does not exist.</li> <li>● When the Master Control input "EN/" is 0, the master control loop is active, the area between the MC N and MCE N is called the Master Control active loop area. All the status of OUT coils or Timers within Master Control active loop area will be cleared to 0. Other instructions will not be executed.</li> </ul>	
Example	<div style="text-align: center;"> <p>Ladder Diagram</p>  </div>	

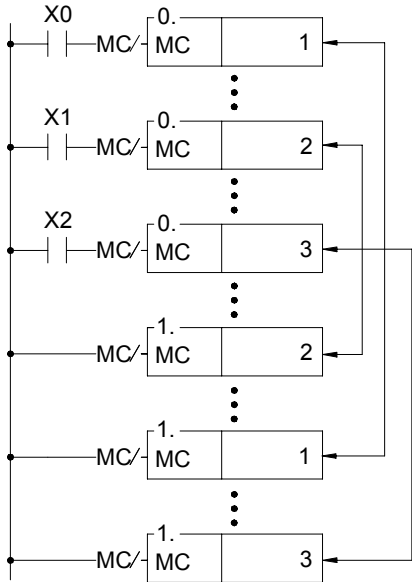

FUN 0 MC	MASTER CONTROL LOOP START	FUN 0 MC
-------------	---------------------------	-------------

Remark1:MC/MCE instructions can be used in nesting or interleaving as shown to the right:

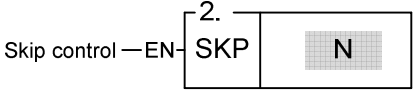

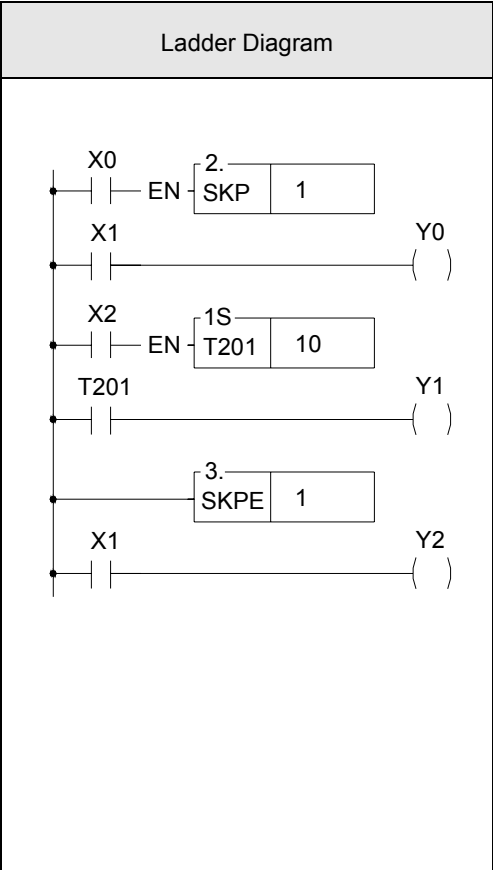

Remark2: When M1918=0 and the master input changes from 0 to 1, and if pulse type function instructions exist in the master control loop, then these instructions will have a chance to be executed only once (when the first time the master control input changes from 0 to 1). Afterwards, no matter how many times the master control input changes from 0 to 1, the pulse type function instructions will not be executed again.

- When M1918=1 and the master control input changes from 0 to 1, and if pulse type function instructions exist in the master control loop, then each time the master control input changes from 0 to 1 the pulse type function instructions in the master control loop will be executed as long as the action conditions are satisfied.
- When a counting instruction exists in the master control loop, set M1918 to 0 can avoid counting error.
- When the pulse type function instructions in the master control loop must act upon the 0 to 1 input change by the master control, the flag M1918 should be set to 1.

Basic Function Instruction

FUN 1 MCE	MASTER CONTROL LOOP END	FUN 1 MCE
Symbol	<p style="text-align: right;"><u>Operand</u></p> <p style="text-align: center;"><u>Ladder symbol</u></p>  <p style="text-align: right;">N: Master Control End number (N=0~127) N can not be used repeatedly.</p>	
Description	<ul style="list-style-type: none"> <li>● Every MCE N must correspond to a Master Control Start instruction. They must always be used as a pair and you should also make sure that the MCE N instruction is after the MC N instruction. After the MC N instruction has been executed, all output coil status and timers will be cleared to 0 and no other instructions will be executed. The program execution will resume until a MCE instruction which has the same N number as MC N instruction appears.</li> <li>● MCE instruction does not require an input control because the instruction itself forms a network which other instructions can not connect to it. If the MC instruction has been executed then the master control operation will be completed when the execution of the program reaches the MCE instruction. If MC N instruction has never been executed then the MCE instruction will do nothing.</li> </ul>	
Description	<ul style="list-style-type: none"> <li>● Please refer to the example and explanations for MC instruction.</li> </ul>	

FUN 2 SKP	SKIP START	FUN 2 SKP
Symbol	<div style="display: flex; justify-content: space-between;"> <div style="text-align: center;"> <p><u>Ladder symbol</u></p>  </div> <div style="text-align: center;"> <p><u>Operand</u></p> <p>N: Skip loop number (N=0~127), N can not be used repeatedly.</p> </div> </div>	
Description	<ul style="list-style-type: none"> <li>● There are total 128 SKP loops (N=0~127). Every skip start instruction, SKP N, must correspond to a skip end instruction, SKPE N, which has the same loop number as SKP N. They must always be used as a pair and you should also make sure that the SKPE N instruction is after the SKP N instruction.</li> <li>● When the skip control "EN" is 0, then the Skip Start instruction will not be executed.</li> <li>● When the skip control "EN" is 1, the range between the SKP N and SKPE N which is so called the Skip active loop area will be skipped, that is all the instructions in this area will not be executed. Therefore the statuses of the discrete or registers in this Skip active loop area will be retained.</li> </ul>	
Example	<div style="border: 1px solid black; padding: 10px; text-align: center;"> <p>Ladder Diagram</p>  </div>

Description	<ul style="list-style-type: none"> <li>● Every SKPE N must correspond to a SKP N instruction. They must always be used as a pair and you should also make sure that the SKPE N instruction is behind the SKP N instruction.</li> <li>● SKPE instruction does not require an input control because the instruction itself forms a network which other instructions can not connect to it. If the SKP N instruction has been executed then the skip operation will be completed when the execution of the program reaches the SKPE N instruction. If SKP N instruction has never been executed then the SKPE instruction will do nothing.</li> </ul>	
Example	<ul style="list-style-type: none"> <li>● Please refer to the example and explanations for SKP N instruction.</li> </ul> <p><b>Remark:</b> SKP/SKPE instructions can be used by nesting or interleaving. The coding rules are the same as for the MC/MCE instructions. Please refer to the section of MC/MCE instructions.</p>	

Basic Function Instruction

FUN 4 DIFU	DIFFERENTIAL UP	FUN 4 DIFU
---------------	-----------------	---------------

**Symbol**

Ladder symbol

Operand

D: a specific coil number where the result of the Differential Up operation is stored.

Range	Y	M	SM	S
Ope- rand	Y0	M0	M1912	S0
	Y255	M1911	M2001	S999
D	○	○	○*	○

**Description**

- The DIFU instruction is used to output the up differentiation of a node status (status input to "TGU↑") and the pulse signal resulting from the status change at the rising edge of the "TG↑" for one scan time is stored to a coil specified by D.
- The functionality of this instruction can also be achieved by using a TU contact.

**Example**      The results of the following two samples are exactly the same

**Ladder Diagram**

**Example 1**

**Example 2**

t : scan time

Description	<ul style="list-style-type: none"> <li>● When the clear counter “CLR” is 1, the counter’s CV will be reset to 0 and the counter will not be able to count.</li> <li>● When the clear counter “CLR” is 0, counting will then be allowed. The nature of the instruction is a P instruction. Therefore, when the clock “PLS” is 0 to 1 (rising edge), the CV will increased by 1 (if U/D=1) or decreased by 1 (if U/D=0).</li> <li>● When CV=Pv, FO0 (“Count-Up) will change to 1”. If there are more clocks input, the counter will continue counting which cause CV≠Pv. Then, FO0 will immediately change to 0. This means the “Count-Up” signal will only be equal to 1 if CV=Pv, or else it will be equal to 0 (Care should be taken to this difference from the “Count-Up” signal of the general counter).</li> <li>● The upper limit of up count value is 32767 (16-bit) or 2147483647 (32-bit). After the upper limit is reached, if another up count clock is received, the counting value will become -32768 or -2147483648 (the lower limit of down count).</li> <li>● The lower limit of down count value is -32767 (16-bit) or -2147483647 (32-bit). After the lower limit is reached, if another down count clock is received, the counting value will become 32768 or 2147483648 (the upper limit of up count).</li> <li>● If U/D is fixed as 1, the instruction will become a single-phase up count counter. If U/D is fixed as 0, the instruction will become a single-phase down count counter.</li> </ul>
-------------	--

FUN 7  UDCTR	UP/DOWN COUNTER (16-bit or 32-bit up/down 2-phase Counter)	FUN 7  UDCTR
--	---	--

**Remark 1:** Since the counting operation of UDCTR is implemented by software scanning, therefore if the clock speed is faster than the scan speed, lose count may then happen (generally the clock should not exceed 20Hz depending on the size of the program). Please use the software or hardware high-speed counter in the controller. Refer to the “High Speed Counter Application” in the Advanced Manual.

**Remark 2:** In order to ensure the proper counting, the sustain time of the status of clock input should greater than 1 scan time.

FUN 8 <b>D</b> <b>P</b> MOV	<b>MOVE</b> (Moves data from S to D)	FUN 8 <b>D</b> <b>P</b> MOV
--------------------------------	---	--------------------------------

**Description**

Ladder symbol

Operand

S: Source register number  
 D: Destination register number  
 The S, N, D may combine with V, Z, P0~P9 to serve indirect addressing

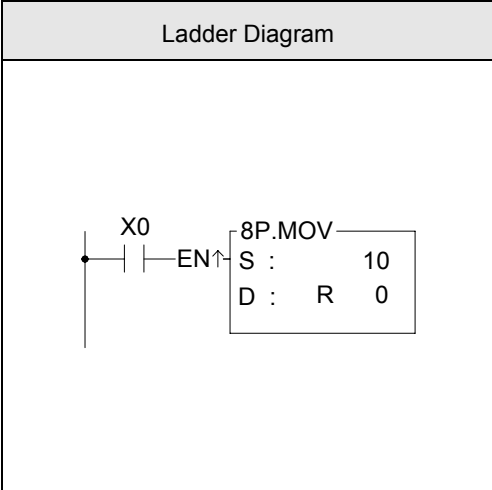

Range	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
Operand	WX0	WY0	WM0	WS0	T0	C0	R0	R3840	R3904	R3968	R5000	D0	16/32-bit +/- number	V · Z

**Description**

- Performs the addition of the unsigned data specified at Sa and Sb and writes the results to a specified register D when "U/S" =0 and the addition control "EN" =1 or "EN↑" (P instruction) changes from 0 to 1. If the result of addition is equal to 0 then set FO0 to 1. If carry occurs (the result exceeds 32767 or 2147483647) then set FO1 to 1. If borrow occurs (adding negative numbers resulting in a sum less than -32768 or -2147483648), then set the FO2 to 1. All the FO statuses are retained until this instruction is executed again and overwritten by a new result.
- Performs the addition of the signed data specified at Sa and Sb and writes the results to a specified register D when "U/S" =1 and the addition control "EN" =1 or "EN↑" (P instruction) changes from 0 to 1. If the result of addition is equal to 0 then set FO0 to 1. If carry occurs (the result exceeds 65535 or 4294967295) then set FO1 to 1.

**Example**      16-bit addition

**Description**

- Performs the subtraction of the unsigned data specified at Sa and Sb and writes the results to a specified register D when "U/S" =0 and the subtraction control "EN" =1 or "EN↑" (P instruction) changes from 0 to 1. If the result of subtraction is equal to 0 then set FO0 to 1. If carry occurs (subtracting a negative number from a positive number and the result exceeds 32767 or 2147483647), then set FO1 to 1. If borrow occurs (subtracting a positive number from a negative number and the resulted difference is less than -32768 or -2147483648), then set FO2 to 1. All the FO statuses are retained until this instruction is executed again and overwritten by a new result.
- Performs the subtraction of the signed data specified at Sa and Sb and writes the results to a specified register D when "U/S" =1 and the subtraction control "EN" =1 or "EN↑" (P instruction) changes from 0 to 1. If the result of subtraction is equal to 0 then set FO0 to 1. If borrow occurs (Sa – Sb < 0), then set FO2 to 1.

**Example**      16-bit subtraction

**Description**

- Performs the multiplication of the unsigned data specified at Sa and Sb and writes the results to a specified register D when "U/S" =0 and the multiplication control "EN" =1 or "EN↑" (P instruction) changes from 0 to 1. If the product of multiplication is equal to 0 then set FO0 to 1. If the product is a negative number, then set FO1 to 1.
- Performs the multiplication of the signed data specified at Sa and Sb and writes the results to a specified register D when "U/S" =1 and the multiplication control "EN" =1 or "EN↑" (P instruction) changes from 0 to 1. If the product of multiplication is equal to 0 then set FO0 to 1.

**Description**

- Subtracts 1 from the register D when the decrement control "EN" =1 or "EN↑" (P instruction) changes from 0 to 1. If the value of D is already at the lower limit of negative number -32768 or -2147483648, subtracting one from this value will change it to the upper limit of positive number 32767 or 2147483647. At the same time, the underflow flag FO0 (UDF) is set to 1.

**Example**      16-bit decrement register

Ladder diagram

D	R0	0

Range	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
Operand	WX0	WY0	WM0	WS0	T0	C0	R0	R3804	R3904	R3968	R5000	D0	16/32 bit +/-number	V · Z
Sa	○	○	○	○	○	○	○	○	○	○	○	○	○	○
Sb	○	○	○	○	○	○	○	○	○	○	○	○	○	○

**Description**

- Compares the unsigned data of Sa and Sb when "U/S" = 0 and the compare control "EN" = 1 or "EN↑" (P instruction) changes from 0 to 1. If the data of Sa is equal to Sb, then set FO0 to 1. If the data of Sa>Sb, then set FO1 to 1. If the data of Sa<Sb, then set FO2 to 1.
- Compares the signed data of Sa and Sb when "U/S" = 1 and the compare control "EN" = 1 or "EN↑" (P instruction) changes from 0 to 1. If the data of Sa is equal to Sb, then set FO0 to 1. If the data of Sa>Sb, then set FO1 to 1. If the data of Sa<Sb, then set FO2 to 1.

**Example**      Compares the data of 16-bit register

**Ladder diagram**

- From the above example, we first assume the data of R0 is 1 and R1 is 2, and then compare the data by executing the CMP instruction. The FO0 and FO1 are set to 0 and FO2 (a<b) is set to 1 since a<b.
- If you want to have the compound results, such as ≥, ≤, <, > etc., please send =, < and > results to relay first and then combine the result from the relays.
- M1919=0, when this command in not executed, FO0, FO1, FO2 will remain in the status at last execution.
- M1919=1, when this command in not executed, FO0, FO1, FO2 are all cleared to 0.
- Control M1919 properly to obtain memory-holding function for functional command output.

**Description**

- Performs logical AND operation for the data of Sa and Sb when the operation control "EN" =1 or "EN↑" (P instruction) changes from 0 to 1. This operation compares the corresponding bits of Sa and Sb (B0~B15 or B0~B31). The bit in the D is set to 1 if both of the corresponding bits data of Sa and Sb is 1. The bit in the D is set to 0 if one of the corresponding bits is 0.

**Example**      Operation of 16-bit logical AND

**Description**

- WSZ-controller uses binary code to store and to execute calculations. If want to send the internal controller data to the external displays such as seven-segment displays, it is more convenient for us to read the result on screen by converting the BIN data to BCD data. For example, it is clearer for us to read the reading "12" instead of the binary code "1100."
- Converts BIN data of the device specified at S into BCD and writes the result in D when the conversion control "EN" =1 or "EN↑" (P instruction) changes from 0 to 1. If the data in S is not a BCD value (0~9999 or 0~9999999), then the error flag FO0 is set to 1 and the old data of D are retained.

**Example**      16-bit BIN to BCD conversion

**Description**

- The decimal (BCD) data must be converted to binary (BIN) data first in order for controller to accept the data which is originally in decimal unit (BCD code) inputted from external device such as digital switch because the BCD data can not be accepted by controller for its operations.
- Converts BCD data of the device specified at S into BIN and writes the result in D when the operation control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1. If the data in S is not in BCD, then the error flag FO0 is set to 1 and the old data of D are retained.
- Constant is converted to BIN automatically when store in program and can not be used as a source operand of this function.

**Example**      16-bit BCD to BIN conversion

Advanced Function Instruction

FUN22 <b>P</b> BREAK	BREAK FROM FOR AND NEXT LOOP (BREAK)	FUN22 <b>P</b> BREAK
-------------------------	---	-------------------------

Ladder symbol

- When execution control "EN"=1 or "EN↑" (**P** instruction) changes from 0 to 1, it will terminate the FOR and NEXT program loop.
- The program within the FOR and NEXT loop will be executed N times (N is assigned by FOR instruction) successively, but if it is necessary to terminate the execution loop less than N times, the BREAK instruction is necessary to apply.
- The BREAK instruction must be located within the FOR and NEXT program loop.

Description : The loop count used to execute the FOR and NEXT program loop is assigned by register D10 ; the program within the FOR and NEXT loop is designed to search the same data storing in D100 from the register table starting at R0.If it finds, the searching loop will be terminated and then it goes to execute the program after the NEXT instruction ; If it doesn't find, the searching loop will be executed N times (N is the content of D10) and then it goes to execute the program after the NEXT instruction. M200 tells the status and D1000 is the pointer of searching.

FUN33 LCNV	Linear Conversion (LCNV)	FUN33 LCNV
---------------	-----------------------------	---------------

Md: Operation mode, 0~3  
 S: Starting address of the source data

L	○		○	○	1~64

- When the analog input module being used for the analog measurement, the raw reading value of the analog input can be converted into the engineering range through this instruction for display or for proceeding control operation.
- For process measurement calibration, making the linear conversion for the engineering process variable, which the measurement value from the Controller's can be corrected by the value from the standard meter's through this instruction.
- When operation control "EN"=1or "EN↑" () instruction) changes from 0 to 1, this instruction will perform the linear conversion operation according to the mode selection, where S is the starting address of the source data, Ts is the starting address of the conversion parameter table, D is the starting address to store the converted result, and L is the quantity of conversion entry.
- There are two expressions to meet the suitable application:

**Expression 1: Two points calibration method**

Fill the conversion parameter table with the low value of measurement(VML), high value of measurement(VMH), and the corresponding low value of standard (VSL), high value of standard(VSH); the converted result(Dn) will be generated from the source data(Sn) through the formula shown below:

$$A = (VSL - VSH / VML - VMH) \times 10000$$

$$B = VSL - (VML \times A / 10000)$$

$$Dn = (Sn \times A / 10000) + B$$

- The range of operands VSL,VSH, VML,VMH,Sn and Dn are between -32768 ~ 32767
- For analog input scaling, where  
 VML=Minimum of analog input  
 VMH=Maximum of analog input  
 VSL=Minimum of engineering range  
 VSH=Maximum of engineering range

FUN33 P  
LCNVLinear Conversion  
(LCNV)FUN33 P  
LCNV**Expression 2: Multiplication + Offset method**

Fill the conversion parameter table with the values of multiplier (A), divisor (B) and offset(C);  
The converted result (Dn) will be generated from the source data (Sn) through the formula shown below:

$$Dn = [(Sn \times A) / B] + C$$

The range of each operand as below:

$$A = 1 \sim 65535$$

$$B = 1 \sim 65535$$

$$C = -32768 \sim 32767$$

$$Sn = 0 \sim 65535$$

$$Dn = -32768 \sim 32767$$

**Description of operation mode:**

1. When Md =0, the linear conversion works by expression 1, and all source data share the same parameters VML, VMH, VSL and VSH for conversion.
2. When Md =1, the linear conversion works by expression 1, and each source data has the independent corresponding parameters VML, VMH, VSL, VSH for conversion; if there are N entries of source data, the conversion parameter table should have N groups of VML, VMH, VSL, VSH for working, there are N×4 registers in the conversion parameter table.
3. When Md =2, the linear conversion works by expression 2, and all source data share the same parameters A, B and C for conversion.
4. When Md =3, the linear conversion works by expression 2, and each source data has the independent corresponding parameters A, B, C for conversion; if there are N entries of source data, the conversion parameter table should have N groups of A, B, C for working, there are N×3 registers in the conversion parameter table.

S : Source register number  
 N : Number of registers to be averaged  
 (N units of successive registers starting from S )  
 D : Register number for storing result (mean value)  
 The S, N, D may combine with V, Z, P0~P9 to serve indirect address application

Range	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
Operand	WX0	WY0	WM0	WS0	T0	C0	R0	R3840	R3904	R3968	R5000	D0	2	V, Z
	WX240	WY240	WM1896	WS984	T255	C255	R3839	R3903	R3967	R4167	R8071	D4095	256	P0~P9
S	○	○	○	○	○	○	○	○	○	○	○	○		○
N	○	○	○	○	○	○	○	○	○	○	○	○	○	○
D		○	○	○	○	○	○		○	○*	○*	○		○

- When operation control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, add the N successive 16-bit or 32-bit (**D** instruction) numerical values starting from S, and then divided by N. Store this mean value (rounding off numbers after the decimal point) in the register specified by D.
- While the N value is derived from the content of the register, if the N value is not between 2 and 256, then the N range error "ERR" will be set to 1, and do not execute the operation.

- At left, the example program gets the mean value of the 3 successive 16-bit registers starting from R0, and stores the results into the 16-bit register R10

D	○	○	○	○	○	○	○	○*	○*	○	○

- When operation control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, negate (ie. calculate 2's complement) the value of the content of the register specified by D, and store it back in the original D register.
- If the value of the content of D is negative, then the negation operation will make it positive.

- The instruction at left negates the value of the R0 register, and stores it back to R0.

D R0    12345    ➡ 3039H

↓ X0 = 1 ↑

D R0    -12345    ➡ CFC7H

Advanced Function Instruction

FUN 28 <b>D P</b> ABS	<b>ABSOLUTE</b> (Take the absolute value)	FUN 28 <b>D P</b> ABS
--------------------------	--	--------------------------

D : Register to be taken absolute value

D may combine with V, Z, P0~P9 to serve indirect address application

Range	WY	WM	WS	TMR	CTR	HR	OR	SR	ROR	DR	XR
Operand	WY0	WM0	WS0	T0	C0	R0	R3904	R3968	R5000	D0	V, Z
	WY240	WM1896	WS984	T255	C255	R3839	R3967	R4167	R8071	D4095	P0~P9
D	○	○	○	○	○	○	○	○*	○*	○	○

- When operation control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, calculate the absolute value of the content of the register specified by D, and write it back into the original D register.

- The instruction at left calculates the absolute value of the R0 register, and stores it back in R0.

FUN 29 EXT	SIGN EXTENSION	FUN 29 EXT
---------------	----------------	---------------

D : Register to be taken sign extension  
 D may combine with V, Z, P0~P9 to serve indirect address application

	Range	WY	WM	WS	TMR	CTR	HR	OR	SR	ROR	DR	XR
	Opere- rand	WY0   WY240	WM0   WM1896	WS0   WS984	T0   T255	C0   C255	R0   R3839	R3904   R3967	R3968   R4167	R5000   R8071	D0   D4095	V, Z   P0~P9
D		○	○	○	○	○	○	○	○*	○*	○	○

- When operation control "EN" =1 or "EN↑" () changes from 0 to 1, this instruction will sign extension the 16 bits numerical value specified by D to 32-bit value and store it into the 32-bit register comprised by the two successive words, D + 1 and D. (Both values are the same, only it was originally formatted as a 16 bits numerical value, and was then extended to be formatted as a 32 bits numerical value.)
- This instruction extent the numerical value of a 16-bit register into an equivalent numerical value in a 32-bit register (for example 33FFH converts to 000033FFH), Its main function is for numerical operations (+,-,\*,/,CMP.....) which can take the 16 bits or 32 bits numerical values as operand. Before operation all the operand should be adjusted to the same length for proper operation.

- The instruction at left takes a 16 bits numerical value R0, and extends it to an equivalent value in 32 bits, then stores it into a 32 bits register (DR0=R1R0) comprised R0 and R1.

↓ X0 = 1 ↑

Before extension ( 16 bits ) R0= CFC7H=-12345  
 After extension ( 32 bits ) R1R0=FFFFCFC7H=-12345 } The two numerical values are actually the same.

Advanced Function Instruction

FUN 30 PID	GENERAL PURPOSE PID OPERATION (Brief description)	FUN 30 PID
---------------	--	---------------

Ladder symbol

Ts : PID Operation time interval

SR : Starting register of process control parameter table comprised by 8 consecutive registers.

OR : PID output register

PR : Starting register of the process parameter table comprised by 7 consecutive registers.

WR : Starting register of working variable for PID internal operation. It requires 7 registers and can't be re-used in other part of the ladder program.

Range Operand	HR	ROR	DR	K
	R0 R3839	R5000 R8071	D0 D4095	
Ts	○	○	○	1~3000
SR	○	○*	○	
OR	○	○*	○	
PR	○	○*	○	
WR	○	○*	○	

- PID function according to the current value of process variable (PV) derived from the external analog signal and the setting value (SP) of process performs the calculation, which base on the PID formula. The result of calculation is the control output for the controlled process, which can feed directly to the AO module or other output interface or leaved for further process. The usage of PID control for process if properly can achieve a fast and smooth result of PV tracking toward SP change or be immune to the disturbance of process.

- The PID formula in digital form:

$$Mn = [(D4005/Pb) \times En] + \sum_0^n [(D4005/Pb) \times Ti \times Ts \times En] - [(D4005/Pb) \times Td \times (PVn - PVn-1)/Ts] + Bias$$

Mn : Control output at time"n"

D4005 : The gain constant, the default is 1000, it's range is 1~5000.

Pb : Proportional band (range: 2~5000, unit 0.1%. Kc (gain) =1000/ Pb)

Ti : Integral time constant (range: 0~9999 corresponds to 0.00~99.99 Repeats/Minute)

Td : Differential time constant (range: 0~9999 corresponds to 0.00~99.99 Minutes)

PVn : Process value at time"n"

PV n-1 : Process value at time"n-1"

En : Error at time"n" =set value (SP) – process value at time"n" (PVn)

Ts : Interval time of PID calculation (range: 1~3000, unit: 0.01s)

Bias : Control output offset (range: 0~16380)

- For detail description of this function, please refer chapter 18.

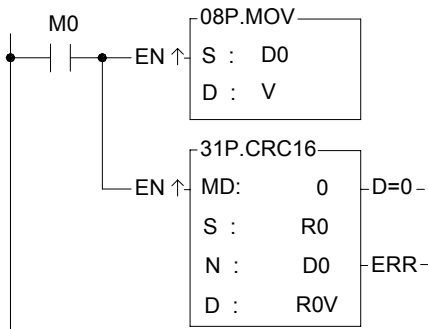

FUN31 <b>P</b> CRC16	CRC16 CALCULATION (CRC16)	FUN31 <b>P</b> CRC16
-------------------------	------------------------------	-------------------------

	Range	HR	ROR	DR	K
Ope- rand		R0	R5000	D0	
		R3839	R8071	D4095	
MD					0~1
S		○	○	○	
N		○	○	○	1~256
D		○	○*	○	

MD : 0, Not including higher byte of registers to be calculated the CRC16  
 : 1, Including higher byte of registers to be calculated the CRC16  
 S : Starting address of CRC16 calculation  
 N : Length of CRC16 calculation (In Byte)  
 D : The destination register to store the calculation of CRC16,  
 Register D stores the Upper Byte of CRC16  
 Register D+1 stores the Lower Byte of CRC16  
 S, N, D may associate with V, Z, P0~P9 index register to serve the indirect addressing application.

- When execution control "EN"=1 or "EN↑" (**P** instruction) changes from 0 to 1, it will start the CRC16 calculation from the lower byte of S and by the length of N, the result of calculation will be stored into register D and D+1.
- The output indication "D=0" will be ON if the value of calculation is 0.
- It will not execute the calculation and the output indication "ERR" will be ON if the length is invalid.
- When communicating with the intelligent peripheral in binary data format, the CRC16 error detection is used very often; the well known Modbus RTU communication protocol uses this method for error detection of message frame.
- CRC16 is the check value of a Cyclical Redundancy Check calculation performed on the message contents.
- Perform the CRC16 calculation on the received message data and error check value, the result of the calculation value must be 0, it means no error within this message frame.

Description : When M0 changes from 0 to 1, it will execute the CRC16 calculation starting from lower byte of R0, the length is assigned by D0, and then stores the CRC value into register R0+V and R0+V+1.  
 It is supposed D0=10, the registers R10 and R11 will store the CRC16 value.

Advanced Function Instruction

FUN32 ADCNV	CONVERTING THE RAW VALUE OF 4~20MA ANALOG INPUT (ADCNV)	FUN32 ADCNV
----------------	--	----------------

PI : 0, the polarity setting of analog input module is at unipolar position  
 : 1, the polarity setting of analog input module is at bipolar position  
 S : Starting address of source registers  
 N : Quantity of conversion (In Word)  
 D : Starting address of destination registers

S, N, D may associate with V, Z, P0~P9 index register to serve the indirect addressing application.

Range	HR	IR	ROR	DR	K
Ope- rand	R0	R3840	R5000	D0	
	R3839	R3903	R8071	D4095	
PI					0~1
S	○	○	○	○	
N	○		○	○	1~64
D	○		○*	○	

- When the analog input is 4~20mA, the analog input module is one of the solution to get this kind of signal, but the input span of the analog input module is 0~20mA (Setting at 10V, Unipolar), however there will exist the offset of the raw reading value; this instruction is applied to eliminate the offset and convert the raw reading value into the range of 0~4095(12-bit) or 0~16383(14-bit), it is more convenient for following operation.
- When execution control "EN" =1, it will execute the conversion starting from S, length by N, and then store the results into the D registers.
- This instruction will not act if invalid length of N.
- When the input "F/T" =0, it assigns the 12-bit analog input module; while "F/T" =1, it assigns the 14-bit analog input module.
- The reading value of the analog input must be in -2048 ~ 2047 or -8192 ~ 8191 formats that the conversion will have the correct correspondence. Otherwise, if the reading value is in 0~4095 or 0~16383 format that the conversion will have the wrong correspondence.

FUN32  
ADCNV

CONVERTING THE RAW VALUE OF 4~20MA ANALOG INPUT  
(ADCNV)

FUN32  
ADCNV

Example :

Description : When M0 is ON and M1 is OFF, it will perform 6 points of conversion starting from R3840, where the offset of 4~20mA raw reading value will be eliminated, and the corresponding value 0~4095 will be stored into R500~R505.

S		⇨	D	
R3840	- 1229		R500	0 (4 mA)
R3841	409		R501	2047 (12 mA)
R3842	2047		R502	4095 (20 mA)
R3843	- 2048		R503	0 (0 mA)
R3844	- 2048		R504	0 (0 mA)
R3845	- 2048		R505	0 (0 mA)

When M0 is ON and M1 is ON, it will perform 6 points of conversion starting from R3840, where the offset of 4~20mA raw reading value will be eliminated, and the corresponding value 0~16383 will be stored into R500~R505.

S		⇨	D	
R3840	- 4916		R500	0 (4 mA)
R3841	1637		R501	8191 (12 mA)
R3842	8191		R502	16383 (20 mA)
R3843	- 8192		R503	0 (0 mA)
R3844	- 8192		R504	0 (0 mA)
R3845	- 8192		R505	0 (0 mA)

FUN 35 <b>D</b> <b>P</b> XOR	EXCLUSIVE OR	FUN 35 <b>D</b> <b>P</b> XOR
---------------------------------	--------------	---------------------------------

Sa : Source data a for exclusive or operation

Sb : Source data b for exclusive or operation

D : Register storing XOR results

Sa, Sb, D may combine with V, Z, P0~P9 to serve indirect address application

Range Ope- rand	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR

S	○	○	○	○	○	○	○	○	○	○	○	○		○
SU	○	○	○	○	○	○	○	○	○	○	○	○	○	○
SL	○	○	○	○	○	○	○	○	○	○	○	○	○	○

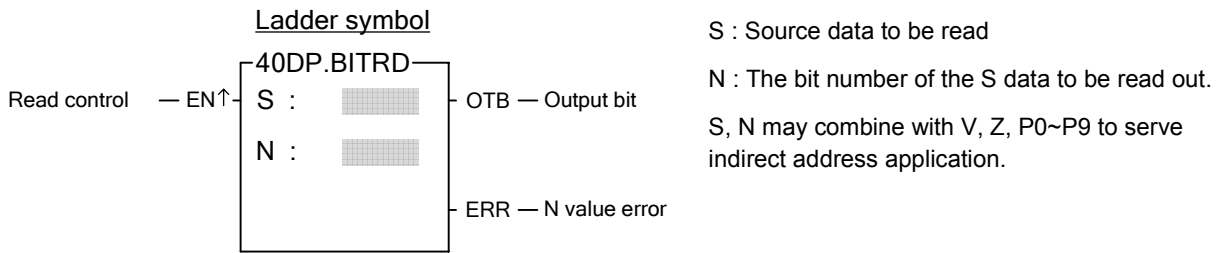

- When operation control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, compares S with upper limit SU and lower limit SL. If S is between the upper limit and the lower limit ( $S_L \leq S \leq S_U$ ), then set the inside zone flag "INZ" to 1. If the value of S is greater than the upper limit  $S_U$ , then set the higher than upper limit flag "S>U" to 1. If the value of S is smaller than the lower limit  $S_L$ , then set the lower than lower limit flag "S<L" as 1.
- The upper limit  $S_U$  should be greater than the lower limit  $S_L$ . If  $S_U < S_L$ , then the limit value error flag "ERR" will set to 1, and this instruction will not carry out.

- The instruction at left compares the value of R0 with the upper and lower limit zones formed by R1 and R2. If the values of R0~R2 are as shown in the diagram at bottom left, then the result can then be obtained as at the right of this diagram.
- If want to get the status of out side the zone, then OUT NOT Y0 may be used, or an OR operation between the two outputs S>U and S<L may be carried out, and move the result to Y0.

- When operation control "EN"=1 or "EN↑"(P instruction) changes from 0 to 1, it will perform the code conversion; where S is the source (Gray code), and D is the destination (Binary code) for storing the result.
- If the operand is 16 bits, the conversion result is stored into one register. If the operand is 32 bits, the conversion result is stored into two registers.
- The conversion method shown as below :

Example 1: When M0 changes from 0→1, it will perform the 16-bit code conversion.

\*Converting the 16-bit Gray-code in D0 into Binary-code, and then storing the result into D100.

D0 = 1001010101010011B → D100 = 1110011001100010B

--------------------------------	-------------------------------------	--------------------------------

Example 2: When M0 =1, it will perform the 32-bit code conversion.

Converting the 32-bit Gray-code in DD0 into Binary-code, and then storing the result into DD100.

DD0 = 00110111001001000010111100010100B → DD100 = 00100101110001111100101000011000B

FUN 57 DECOD	DECODE	FUN 57 DECOD
-----------------	--------	-----------------

S : Source data register to be decoded (16 bits)  
 N<sub>S</sub> : Starting bits to be decoded within S  
 N<sub>L</sub> : Length of decoded value (1~8 bits)  
 D : Starting register storing decoded results (2~256 points = 1~16 words).  
 S, N<sub>S</sub>, N<sub>L</sub>, D may combine with V, Z, P0~P9 to serve indirect address application.

Range Operand	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
	WX0   WX240	WY0   WY240	WM0   WM1896	WS0   WS984	T0   T255	C0   C255	R0   R3839	R3840   R3903	R3904   R3967	R3968   R4167	R5000   R8071	D0   D4095	16-bit +/- number	V, Z P0~P9
S	○	○	○	○	○	○	○	○	○	○	○	○	○	○
N <sub>S</sub>	○	○	○	○	○	○	○	○	○	○	○	○	○	○
N <sub>L</sub>	○	○	○	○	○	○	○	○	○	○	○	○	○	○
D		○	○	○	○	○	○	○	○	○*	○*	○		○

- This instruction, will set a single bit among the total of 2<sup>N<sub>L</sub></sup> discrete points (D) to 1 and the others bit are set to 0. The bit number to be set to 1 is specified by the value comprised by BN<sub>S</sub>~BN<sub>S</sub>+N<sub>L</sub>-1 of S (which is called the decode value, BN<sub>S</sub> is the starting bit of the decode value, and BN<sub>S</sub>+N<sub>L</sub>-1 is the end value) .
- When decode control "EN" =1 or "EN↑" () instruction) changes from 0 to 1, will take out the value BN<sub>S</sub>~BN<sub>S</sub>+N<sub>L</sub>-1 from S. And with this value to locate the bit position and set D accordingly, and set all the other bit to zero.
- This instruction only provides 16 bits operand, which means S only has B0~B15. Therefore the effective range of N<sub>S</sub> is 0~15, and the N<sub>L</sub> length of the decode value is limited to 1~8 bits. Therefore the width of the decoded result D is 2<sup>1~8</sup> points = 2~256 points = 1~16 words (if 16 points are not sufficient, 1 word is still occupied). If the value of N<sub>S</sub> or N<sub>L</sub> is beyond the above range, will set the range-error flag "ERR" to 1, and do not carry out this instruction.
- If the end bit value exceeds the B15 of S, then will extend toward B0 of S + 1. However if this occurs then S+1 can't exceed the range of specific type of operand (ie. If S is of D type register then S+1 can't be D+1). If violate this, then this instruction only takes out the bits from starting bit BN<sub>S</sub> to its highest limit as the decode value.

- The instruction at left takes out the data of five successive bits from X3 to X7 within the WX0 register and decodes it. The results are then stored in the 32-bit register starting at R2.

Because N<sub>L</sub>=5, the width of D is 2<sup>5</sup>= 32 points = 2 words. That is, D is formed by R3R2, and the decoded value is 01001=9, therefore B9 (the 10th point) within D is set to 1, and all other points are 0.

FUN 58 <b>P</b> ENCOD	ENCODE	FUN 58 <b>P</b> ENCOD
--------------------------	--------	--------------------------

Ladder symbol

Encode control — EN↑  
High/Low priority — H/L

58P.ENCOD

S : [ ] — D=0 — All is 0  
Ns : [ ] — ERR — Range error  
NL : [ ]  
D : [ ]

S : Starting register to be encoded  
Ns : Bit position within S as the encoding start point  
NL : Number of encoding discrete points (2~256)  
D : Number of register storing encoding results (1 word)  
S, Ns, NL, D may combine with V, Z, P0~P9 to serve indirect address application.

Range Operand	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
	WX240	WY240	WM1896	WS984	T255	C255	R3839	R3903	R3904	R3967	R5000	R8071	D0 D4095	16-bit +/- number
S	○	○	○	○	○	○	○	○	○	○	○	○		○
Ns	○	○	○	○	○	○	○	○	○	○	○	○	0~15	○
NL	○	○	○	○	○	○	○	○	○	○	○	○	2~256	○
D		○	○	○	○	○	○		○	○*	○*	○		○

- When encode control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, will starting from the points specified by Ns within S, take out towards the left (high position direction) NL number of successive bits BNs~BNs+NL-1 (BNs is called the encoding start point, and its relative bit number is b0;BNs+NL-1 is called the encoding end point, and its relative bit number is bNL-1). From left to right do higher priority (when H/L=1) encoding or from right to left do lower priority (when H/L=0) encoding (i.e. seek the first bit with the value of 1, and the relative bit number of this point will be stored into the low byte (B0~B7) of encoded resultant register D, and the high byte of D will be filled with 0.

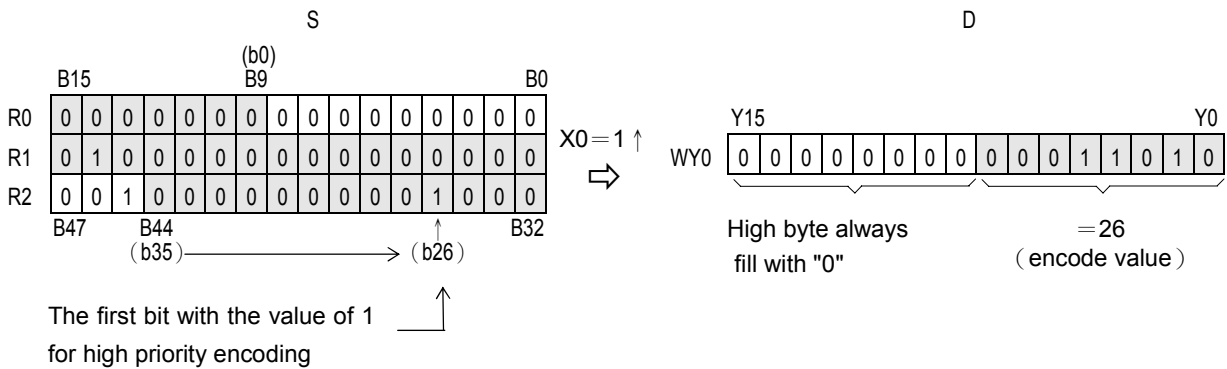

- As shown in the diagram above, for high priority encoding, the bit first to find is bH (with a value of 12), and for low priority encoding, the bit first to find bL (with a value of 4). Among the NL discrete points there must be at least one bit with value of 1. If all bits are 0, will not to carry out this instruction, and the all zero flag "D=0" will set to 1.
- Because S is a 16-bit register, Ns can be 0~15, and is used to assign a point of B0~B15 within S as the encoding start point (b0). The value of NL can be 2~256, and it is used to identify the encoding end point, i.e. it assigns NL successive single points starting from the start point (b0) towards the left (high position direction) as the encoding zone (i.e. b0~bNL-1). If the value of Ns or NL exceeds the above value, then do not carry out this instruction, and set the range-error flag "ERR" as 1.

FUN 58 ENCOD	ENCODE	FUN 58 ENCOD
-----------------	--------	-----------------

- If the encoding end point ( $b_{N_L-1}$ ) beyond the B15 of S, then continue extending towards S+1, S+2, but it must not exceed the range of specific type of operand. If it goes beyond this, then this instruction can only take the discrete points between b0 and the highest limit into account for encoding.

- The instruction at left is a high priority encode example. When X0 goes from 0 to 1, will take out toward left 36 successive bits starting from B9 ( $b_0$ ) specified by Ns within S, and perform high priority encoding (because  $H/L = 1$ ). That is, starting from b35 (encoding end point), move right to find the first bit with the value of 1. The resultant value of this example is b26, so the value of D is 001AH=26, as shown in the diagram below.

<b>FUN 59 P</b> →7SG	<b>7-SEGMENT CONVERSION</b>	<b>FUN 59 P</b> →7SG
-------------------------	-----------------------------	-------------------------

Range	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR

N	○	○	○	○	○	○	○	○	○	○	○	○	0~3	○
D		○	○	○	○	○	○		○	○*	○*	○		○

- When conversion control "EN" =1 or "EN↑" (P instruction) changes from 0 to 1, will convert N+1 number of nibbles (A nibble is comprised by 4 successive bits, so B0~B3 of S form nibble 0, B4~B7 form nibble 1, etc...) within S to 7-segment code, and store the code into a low byte of D (High bytes does not change). The 7 segment within D are put in sequence, with "a" segment placed at B6, "b" segment at B5, .... , "g" segment at B0. B7 is not used and is fixed as 0.
- Because this instruction is limited to 16 bits, and S only has 4 nibbles (NB0~NB3), the effective range of N is 0~3. Beyond this range, will set the N value flag error "ERR" to 1, and does not carry out this instruction.
- Care should be taken on total nibbles to be converted is N+1. N=0 means one digit to convert, N=1 means two digits to convert etc...

FUN 59   
→7SG

7-SEGMENT CONVERSION

FUN 59   
→7SG

〈 Example 1 〉 When M1 OFF→ON, convert hexadecimal to 7-Segment.

- Figure left shown the conversion of first digit (nibble) of R0 to 7-segment and store in low byte of R100, the high byte of R100 remain unchanged.

Original R100=0000H  
 R0=0001H → R100=0030H ( 1 )

〈 Example 2 〉 When M1 ON, convert the hexadecimal to 7-Segment.

- Instruction at left will convert the first and the second digit of R0 to 7-segment and store in R100.
- The low byte of R100 stores first digit.
- The high byte of R100 stores second digit.

R0=0056H → R100=5B5FH ( 56 )

〈 Example 3 〉 When M1 ON, converting hexadecimal to 7-Segment.

- Instruction at left will convert the first, second and third digit of R0 to 7-segment and store in R100 and R101.
- The low byte of R100 stores first digit.
- The high byte of R100 stores second digit.
- The low byte of R101 stores third digit.
- The high byte of R101 remain unchanged.

Original R101=0000H  
 R0=0A48H → R100=337FH ( 48 )  
 R101=0077H ( A )

〈 Example 4 〉 When M1 ON, convert hexadecimal to 7-Segment.

- Instruction at left will convert 1~4 digit of R0 to 7-segment and store in R100 and R101.
- The low byte of R100 stores first digit.
- The high byte of R100 stores second digit.
- The low byte of R101 stores third digit.
- The high byte of R101 stores 4<sup>th</sup> digit.

R0=2790H → R100=7B7EH ( 90 )  
 R101=6D72H ( 27 )

<b>FUN 61 P</b> →SEC	<b>HOUR : MINUTE : SECOND TO SECONDS CONVERSION</b>	<b>FUN 61 P</b> →SEC
-------------------------	---	-------------------------

Range	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR
	Oper- rand	WX0   WX240	WY0   WY240	WM0   WM1896	WS0   WS984	T0   T255	C0   C255	R0   R3839	R3840   R3903	R3904   R3967	R3968   R4167	R5000   R8071
S	○	○	○	○	○	○	○	○	○	○	○	○
D		○	○	○	○	○	○			○*	○*	○

- When conversion control "EN" =1 or "EN↑" (P instruction) changes from 0 to 1, will convert the hour: minute: second data of S~S+2 into an equivalent value in seconds and store it into the 32-bit register formed by combining D and D+1. If the result = 0, then set the "D = 0" flag as 1.
- Among the WSZ-controller instructions, the hour: minute: second time related instructions (FUN61 and 62) use 3 words of register to store the time data, as shown in the diagram below. The first word is the second register, the second word is the minute register, and finally the third word is the hour register, and in the 16 bits of each register, only B14~B0 are used to represent the time value. While bit B15 is used to express whether the time values are positive or negative. When B15 is 0, it represents a positive time value, and when B15 is 1 it represents a negative time value. The B14~B0 time value is represented in binary, and when the time value is negative, B14~B0 is represented with the 2's complement. The number of seconds that results from this operation is the result of summation of seconds from the three registers representing hours: minutes: seconds.

- Besides FUN61 or 62 instructions which treat hour: minute: second registers as an integral data, other instructions treat it as individual registers.
- The example program at below converts the hour: minute: second data formed by R20~R22 into their equivalent value in seconds then stored in the 32-bit register formed by R50~R51. The results are shown below.

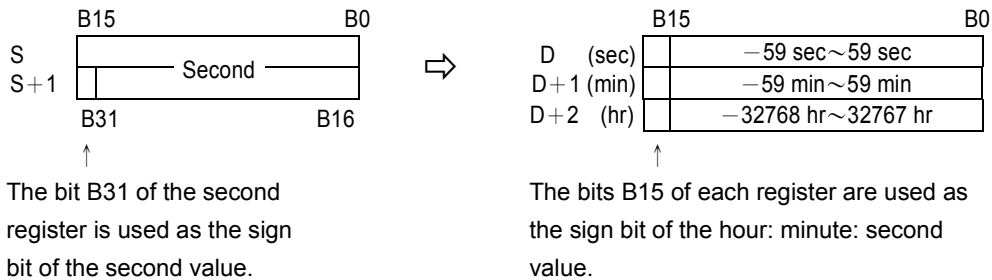

Advanced Function Instruction

FUN 62 →HMS	SECOND→HOUR : MINUTE : SECOND	FUN 62 →HMS
----------------	-------------------------------	----------------

Range	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K
Ope- rand	WX0	WY0	WM0	WS0	T0	C0	R0	R3840	R3904	R3968	R5000	D0	-117968399
	WX240	WY240	WM1896	WS984	T255	C255	R3839	R3903	R3967	R4167	R8071	D4095	117964799
S	○	○	○	○	○	○	○	○	○	○	○	○	○
D		○	○	○	○	○	○		○	○*	○*	○	

- When conversion control "EN" =1 or "EN↑" () changes from 0 to 1, will convert the second data from the S~S+1 32-bit register into the equivalent hour : minute : second time value and store it in the three successive registers D~D+2. All the data in this instruction is represented in binary. (if there is a negative value it is represented using the 2's complement.)

- As shown in the diagram above, after convert to hour : minute : second value, the minute : second value can only be in the range of -59 to 59, and the hour number can be in the range of -32768 to 32767 hours. Because of this, the maximum limit of D is -32768 hours, -59 minutes, -59 seconds to 32767 hours, 59 minutes, 59 seconds, the corresponding second value of S which is in the range of -117968399 to 117964799 seconds. If the S value exceeds this range, this instruction cannot be carried out, and will set the over range flag "OVR" to 1. If S = 0 then result is 0 flag "D = 0" will be set to 1.
- The program in the diagram below is an example of this instruction. Please note that the content of the registers are denoted by hexadecimal, and on the right is its equivalent value in decimal notation.

<b>FUN 63 <span style="border: 1px solid black; padding: 0 2px;">P</span></b> →HEX	<b>CONVERSION OF ASCII CODE TO HEXADECIMAL VALUE</b>	<b>FUN 63 <span style="border: 1px solid black; padding: 0 2px;">P</span></b> →HEX
---	--	---

S : Starting source register.  
 N : Number of ASCII codes to be converted to hexadecimal values.  
 D : The starting register that stores the result (hexadecimal value).  
 S, N, D, can associate with V, Z, P0~P9 to do the indirect addressing application.

Range Operand	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
	WX0   WX240	WY0   WY240	WM0   WM1896	WS0   WS984	T0   T255	C0   C255	R0   R3839	R3840   R3903	R3904   R3967	R3968   R4167	R5000   R8071	D0   D4095	16-bit +number	V, Z P0~P9

- When conversion control “EN” =1 or “EN↑” (P instruction) changes from 0 to 1, will convert the N successive nibbles of hexadecimal value in registers start from S into ASCII code, and store the result to low byte (high byte remain unchanged) of the registers which start from D.
- The conversion will not be performed when the value of N is 0 or greater than 511.
- The main purpose of this instruction is to convert the numerical value data, which controller has processed, to ASCII code and transmit to ASCII peripherals by communication port1 or communication port 2.

〈Example 1〉 When M1 changes from OFF→ON, it converts hexadecimal value to ASCII code.

- Converts the Nibble 0 of R0 to ASCII code and stores it into R100 (High byte does not change).

R0=0009H      →      R100=0039H (9)

〈Example 2〉 When M1 is ON, it converts hexadecimal value to ASCII code.

- Converts the NB0~NB1 of R0 to ASCII code and stores it into R100 ~ R101 (high bytes remain unchanged).

R0=009AH      →      R100=0039H (9)  
R101=0041H (A)

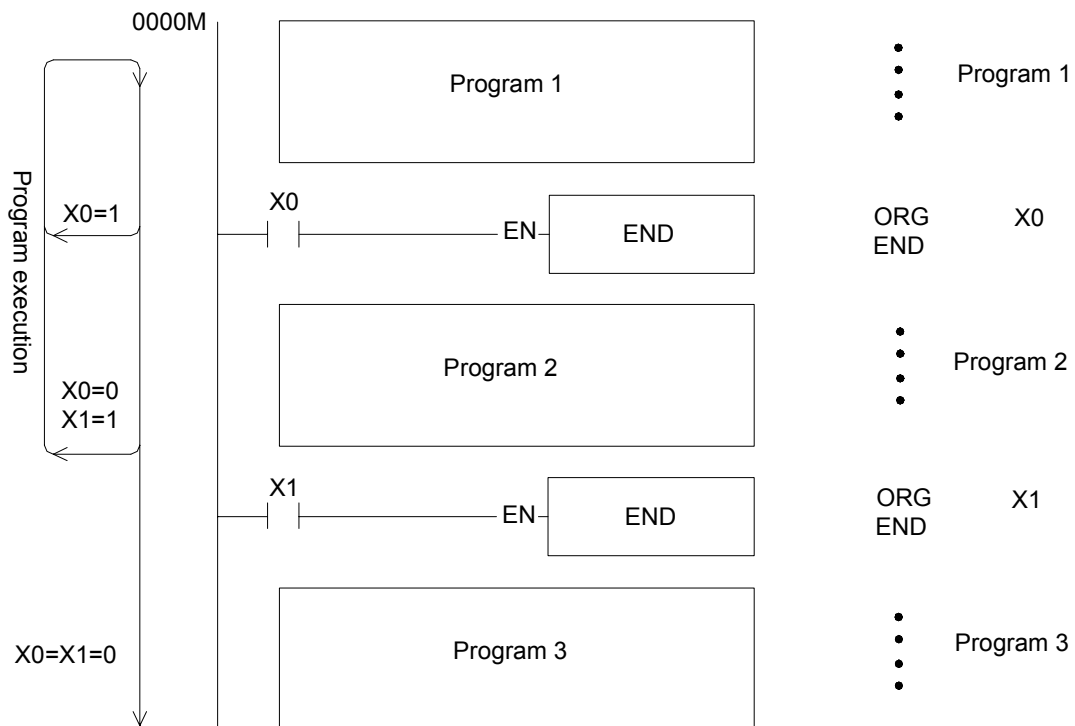

END	PROGRAM END	END
-----	-------------	-----

Ladder symbol

- When end control "EN" =1, this instruction is activated. Upon executing the END instruction and "EN" =1, the program flow will immediately returns to the starting point (0000M) to restart the next scan – i.e. all the programs after the END instruction will not be executed. When "EN" =0, this instruction is ignored, and programs after the END instruction will continue to be executed as the END instruction is not exist.
- This instruction may be placed more than one point within a program, and its input (end control "EN") controls the end point of program execution. It is especially useful for debugging and for testing.
- It's not necessary to put any END instructions in the main program, CPU will automatic restart from start point when reach the end of main program.

Advanced Function Instruction

FUN 65 LBL	LABEL	FUN 65 LBL
---------------	-------	---------------

Ladder symbol

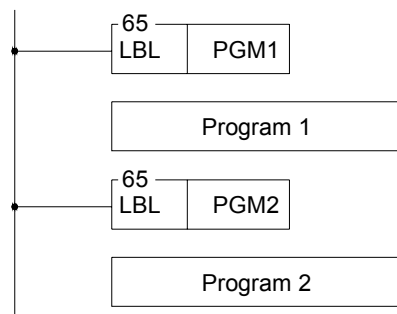

S : Alphanumeric, 1~6 characters

- This instruction is used to make a tag on certain address within a program, to provide a target address for execution of JUMP, CALL instruction and interrupt service. It also can be used for document purpose to improve the readability and interpretability of the program.
- This instruction serves only as the program address marking to provide the control of procedure flow or for remark. The instruction itself will not perform any actions; whether the program contains this instruction or not, the result of program execution will not be influenced by this instruction.
- The label name can be formed by any 1~6 alphanumeric characters and can't be duplicate in the same program. The following label names are reserved for interrupt function usage. These "reserved words", can't be used for normal program labels.

Reserved words	Description
X0+I~X15+I ( INT0~INT15 ) X0-I~X15-I ( INT0~-INT15- )	labels for external input (X0~X15) interrupt service routine.
HSC0I~HSC7I	labels for high speed counter HSC0~HSC7 interrupt service routine.
1MSI ( 1MS ) , 2MSI ( 2MS ) , 3MSI ( 3MS ) , 4MSI ( 4MS ) , 5MSI ( 5MS ) , 10MSI ( 10MS ) , 50MSI ( 50MS ) , 100MSI ( 100MS )	Labels for 8 kinds of internal timer interrupt service routine.
HSTAI ( ATMRI )	Label for High speed fixed timer interrupt service routine.
PSO0I~PSO3I	Labels for the pulse output command finished interrupt service routine.

Only the interrupt service routine can use the label names listed on above table, if mistaken on using the reserved label on the normal subroutine can cause the CPU fail or unpredictable operation.

The label of following diagram illustration served only as program remarks (it is not treated as a label for call or jump target). For the application of labeling in jump control, please refer to JMP instruction for explanation. As to the labeling serves as subroutine names, please refer to CALL instruction for details.

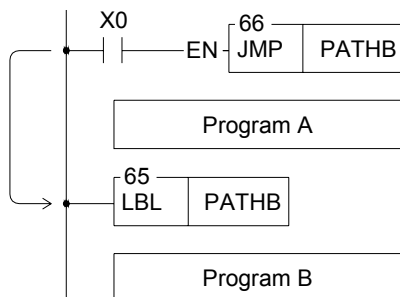

FUN 66  JMP	JUMP	FUN 66  JMP
---	------	---

Ladder symbol

LBL : The program label to be jumped

- When jump control “EN”=1 or “EN↑” ( instruction) changes from 0 to 1, controller will jump to the location behind the marked label and continuous to execute the program.
- This instruction is especially suit for the applications where some part of the program will be executed only under certain condition. This can shorter the scan time while not executes the whole program.
- This instruction allows jump backward (i.e. the address of LBL is comes before the address of JMP instruction). However, care should be taken if the jump action cause the scan time exceed the limit set by the watchdog timer, the WDT interrupt will be occurred and stop executing.
- The jump instruction allows only for jumping among main program or jumping among subroutine area, it can't jump across main/subroutine area.

- In the left diagram, when X0=1, the program will jump directly to the LBL position named PATHB and continuing to execute program B. Therefore it will skip the program A and none of the instructions of program A will be executed. The status of registers and the coils associated with program A will keep unchanged (as if there is no program section A).

Advanced Function Instruction

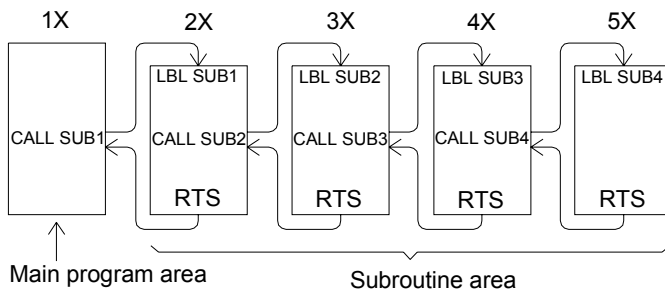

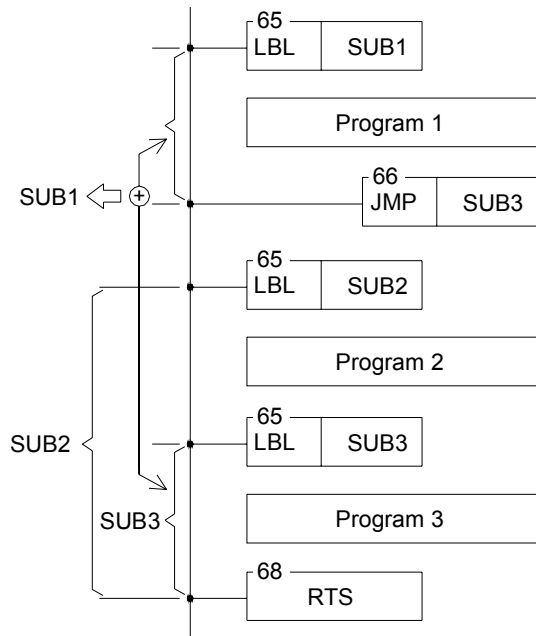

FUN 67 CALL	CALL	FUN 67 CALL
----------------	------	----------------

Ladder symbol

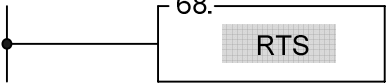

LBL : The subroutine label name to be called.

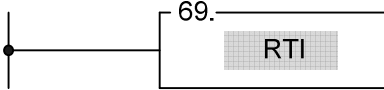

- When call control “EN”=1 or “EN↑” () instruction) changes from 0 to 1, controller will call (perform) the subroutine bear the same label name as the one being called. When execute the subroutine, the program will execute continuous as normal program does but when the program encounter the RTS instruction then the flow of the program will return back to the address immediately after the CALL instruction.
- All the subroutines must end with one “return from subroutine instruction RTS” instruction; otherwise it will cause executing error or CPU shut down. Nevertheless, an RTS instruction can be shared by subroutines (so called as multiple entering subroutines; even though the entry points are different, they have a same returning path) as illustrated in the right diagram subroutine SUB1~3.
- When main program called a subroutine, the subroutine also can call the other subroutines (so called the nested subroutines) for up to 5 levels at the most (include the interrupt routine).

- Interrupt service programs (HSC0I~HSC7I, PSO0I~PSO3I, X0+I~X15+I / INT0~INT15, X0-I~X15-I / INT0-~INT15-, HSTAI / ATMRI, 1MS / 1MS, 2MSI / 2MS, 3MSI / 3MS, 4MSI / 4MS, 5MSI / 5MS, 10MSI / 10MS, 50MSI / 50MS, 100MSI / 100MS) are also a kind of subroutine. It is also placed in sub program area. However, the calling of interrupt service program is triggered off by the signaling of hardware to make the CPU perform the corresponding interrupt service program (which we called as the calling of the interrupt service program). The interrupt service program can also call subroutine or interrupted by other interrupts with higher priority. Since it is also a subroutine (which occupied one level), it can only call or interrupted by 4 levels of subroutine or interrupt service program. Please refer to RTI instruction for explanation.

FUN 68 RTS	RETURN FROM SUBROUTINE	FUN 68 RTS
<p style="text-align: center;"><u>Ladder symbol</u></p> 		
<ul style="list-style-type: none"> <li>● This instruction is used to represent the end of a subroutine. Therefore it can only appear within the subroutine area. Its input side has no control signal, so there is no way to serially connect any contacts. This instruction is self sustain, and is directly connected to the power line.</li> <li>● When controller encounter this instruction, it means that the execution of a subroutine is finished. Therefore it will return to the address immediately after the CALL instruction, which were previously executed and will continue to execute the program.</li> <li>● If this instruction encounters any of the three flow control instructions MC, SKP, or JMP, then this instruction may not be executed (it will be regarded as not exist). If the above instructions are used in the subroutine and causing the subroutine not to execute the RTS instruction, then controller will halt the operation and set the M1933 ( flow error flag) to 1. Therefore, no matter what the flow is going, it must always ensure that any subroutine must be able to execute a matched RTS instruction.</li> <li>● For the usage of the RTS instruction please refer to instructions for the CALL instruction.</li> </ul>		

Advanced Function Instruction

FUN 69 RTI	RETURN FROM INTERRUPT	FUN 69 RTI
<p style="text-align: center;"><u>Ladder symbol</u></p> 		
<ul style="list-style-type: none"> <li>● The function of this instruction is similar to RTS. Nevertheless, RTS is used to end the execution of sub program, and RTI is used to end the execution of interrupt service program. Please refer to the explanation of RTS instruction.</li> <li>● A RTI instruction can be shared by more than one interrupt service program. The usage is the same as the sharing of an RTS by many subroutines. Please refer to the explanation of CALL instruction.</li> <li>● The difference between interrupts and call is that the sub program name (LBL) of a call is defined by user, and the label name and its call instruction are included in the main program or other sub program. Therefore, when controller performs the CALL instruction and the input “EN”=1, the controller will call (execute) this sub program. For the execution of interrupt service program, it is directly used with hardware signals to interrupt CPU to pause the other less important works, and then to perform the interrupt service program corresponding to the hardware signal (we call it the calling of interrupt service program). In comparing to the call instruction that need to be scanned to execute, the interrupt is a more real time in response to the event of the outside world. In addition, the interrupt service program cannot be called by label name; therefore we preserve the special “reserved words” label name to correspond to the various interrupts offered by controller (check FUN65 explanation for details). For example, the reserved word X0+I is assigned to the interrupt occurred at input point X0; as long as the sub program contains the label of X0+I, when input point X0 interrupt is occurred (X0: ↑), the controller will pause the other lower priority program and jump to the subroutine address which labeled as X0+I to execute the program immediately.</li> <li>● If there is an interrupt occurred while CPU is handling the higher priority (such as hardware high speed counter interrupt) or same priority interrupt program (please refer to Chapter 9-3 for priority levels), the controller will not execute the interrupt program for this interrupt until all the higher priority programs were finished.</li> <li>● If the RTI instruction cannot be reached and performed in the interrupt service routine, may cause a serious CPU shut down. Consequently, no matter how you control the flow of program, it must be assured that the RTI instruction will be executed in any interrupt service program.</li> <li>● For the detailed explanation and example for the usage of interrupts, please refer to Chapter 9 for explanation.</li> </ul>		

FUN 70 FOR	FOR	FUN 70 FOR
---------------	-----	---------------

Ladder symbol

N : Number of times of loop execution

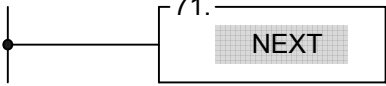

Range	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K
Op- erand	WX0	WY0	WM0	WS0	T0	C0	R0	R3840	R3904	R3968	R5000	D0	1
	WX240	WY240	WM1896	WS984	T255	C255	R3839	R3903	R3967	R4167	R8071	D4095	16383
N	○	○	○	○	○	○	○	○	○	○	○	○	○

- This instruction has no input control, is connected directly to the power line, and cannot be in series with any conditions.
- The programs within the FOR and NEXT instructions form a program loop (the start of the loop program is the next instruction after FOR, and the last is the instruction before NEXT). When controller executes the FOR instruction, it first records the N value after that instruction (loop execution number), then for N times successively execution from start to last of the programs in the loop. Then it jumps out of the loop, and continues executes the instruction immediately after the NEXT instruction.
- The loop can have a nested structure, i.e. the loop includes other loops, like an onion. 1 loop is called a level, and there can be a maximum of 5 levels. The FOR and NEXT instructions must be used in pairs. The first FOR instruction and the last NEXT instruction are the outermost (first) level of a nested loop. The second FOR instruction and the second last NEXT instruction are the second level, the last FOR instruction and the first NEXT instruction form the loop's innermost level.

- In the example in the diagram at left, loop ① will be executed  $4 \times 3 \times 2 = 24$  times, loop ② will be executed  $3 \times 2 = 6$  times, and loop ③ will be executed 2 times.
- If there is a FOR instruction and no corresponding NEXT instruction, or the FOR and NEXT instructions in the nested loop have not been used in pairs, or the sequence of FOR and NEXT has been misplaced, then a syntax error will be generated and this program may not be executed.
- In the loop, the JMP instruction may be used to jump out of the loop. However, care must be taken that once the loop has been entered (and executed to the FOR instruction), no matter how the program flow jumps, it must be able to reach the NEXT instruction before reaching the END instruction or the bottom of the program. Otherwise WSZ-controller will halt the operation and show an error message.
- The effective range of N is 1~16383 times. Beyond this range WSZ-controller will treat it as 1. Care should be taken, if the amount of N is too large and the loop program is too big, a WDT may occur.

## Advanced Function Instruction

FUN 71 NEXT	LOOP END	FUN 71 NEXT
<p><u>Ladder symbol</u></p>  <p>The diagram shows a ladder logic symbol for the FUN 71 NEXT instruction. It consists of a vertical line on the left with a small circle at its top end. A horizontal line extends from this circle to the left side of a rectangular box. Inside the box, the number '71.' is positioned at the top left, and the word 'NEXT' is centered below it. The 'NEXT' text is set against a shaded rectangular background.</p>		
<ul style="list-style-type: none"><li>● This instruction and the FOR instruction together form a program loop. The instruction itself has no input control, is connected directly to the power line, and cannot be in series with any conditions.</li><li>● When controller has not yet entered the loop (has not yet executed to the FOR instruction, or has executed but then jumped out), but the NEXT instruction is reached, then controller will not take any action, just as if this instruction did not exist.</li><li>● For the usage of this instruction please refer to the explanations for the FOR instruction on the preceding page.</li></ul>		

FUN 74 IMDIO	IMMEDIATE I/O	FUN 74 IMDIO
-----------------	---------------	-----------------

Ladder symbol

D : Starting number of I/O points to be refreshed  
 N : Number of I/O points to be refreshed

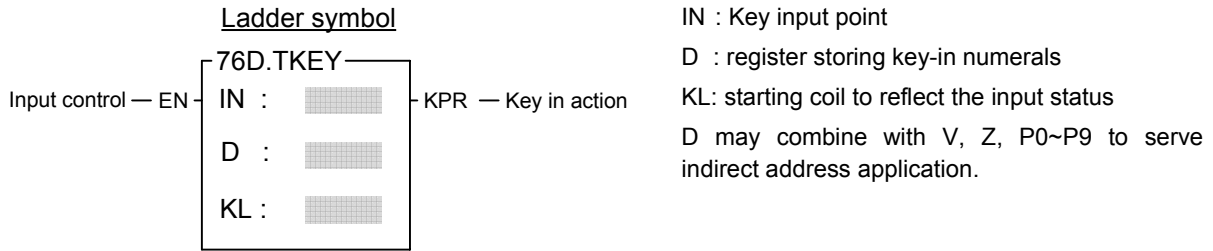

Range	X	Y	K
Ope- rand	Xn of Main Unit.	Yn of Main Unit.	1   36
D	○	○	
N			○

- For normal controller scan cycle, the CPU gets the entire input signals before the program is executed, and then performs the executing of program based on the fresh input signals. After finished the program execution the CPU will update all the output signals according to the result of program execution. Only after the complete scan has been finished will all the output results be transferred all at once to the output. Thus for the input event to output responses, there will be a delay of at least 1 scan time (maximum of 2 scan time). With this instruction, the input signals or output signals specified by this instruction can be immediately refresh to get the faster input to output response without the limitation imposed by the scan method.
- When refresh control "EN" =1 or "EN↑" ( instruction) changes from 0 to 1, then the status of N input points or output points (D~D+N-1) will be refreshed.
- The I/O points for WSZ-controller's immediate I/O are only limited to I/O points on the main unit. The table below shows permissible I/O numbers for 24, 32, 40 and 60 point main units:

Main-unit type	24 points	32 points	40 points	60 points
Permissible numbers				
Input signals	X0~X13	X0~X19	X0~X23	X0~X35
Output signals	Y0~Y9	Y0~Y11	Y0~Y15	Y0~Y23

- If the intended refresh I/O signals of this instruction are beyond the range of I/O points specified on above table then controller will be unable to operate and the M1931 error flag will be set to 1. (For example, if in a program, D=X11, N=10, which means X11 to X20 are to be immediately retrieved. Supposing the main unit is WSZ-32MCT2, then its biggest input point is X19, and clearly X20 has already exceeded the main unit's input point number so under such case M1931 error flag will be set to 1).
- With this instruction, controller can immediately refresh input/output signals. However, the delay of the hardware or the software filter impose on the I/O signals still exist. Please pay attention on this.

<b>FUN 76</b> <span style="border: 1px solid black; padding: 0 2px;">D</span> TKEY	DECIMAL- KEY INPUT	<b>FUN 76</b> <span style="border: 1px solid black; padding: 0 2px;">D</span> TKEY

- This instruction has designated 10 input points IN~IN+9 (IN0~IN9) to one decimal number entry (IN->0, IN+1->1...). According to the key-in sequence (ON) of these input points, it is possible to enter 4 or 8 decimal numbers into the registers specified by D.
- When input control "EN" =1, this instruction will monitor the 10 input points starting from IN and put the corresponding number into D register while the key were depressed. It will wait until the input point has released, then monitor the next "ON" input point, and shift in the new number into D register (high digit is older than low digit) . For the 16-bit operand, D register can store up to 4 digits, and for the 32-bit operand 8 digits may be stored. When the key numbers fulfill the D register, new key-in number will kick out the oldest key number of the D register. The key-in status of the 10 input points starting from IN will be recorded on the 10 corresponding coil starting from KL. These coils will set to 1 while the corresponding key is depressed and remain unchanged even if the corresponding key is released. If other key is depressed, it will return to zero. As long as any input point is depressed (ON), then the key-in flag KPR will set to 1. Only one of IN0~IN9 key can be depressed at the same time. If more than one is pressed, then the first one is the only one taken. Below is a schematic diagram of the function with 16-bit operand.
- When input control "EN" = 0, this instruction will not be executed. KPR output and KL coil status will be 0. However, the numerical values of D register will remain unchanged.

- The instruction at left represents the input point X0 with the number "0", X1 is represented by 1, ... , M0 records the action of X0, M1 records the action of X1 ... , and the input numerical values are stored in the R0 register.

KL		○	○	○											
WR										○			○*	○	

- The numeric (0~9) key function of this instruction is similar as for the TKEY instruction. The hardware connection for TKEY and HKEY is different. For TKEY instruction each key have one input point to connect, while HKEY use 4 input points and 4 output points to form a 4x4 multiplex 16 keys input. 4x4 means that there can be 16 input keys, so in addition to the 10 numeric keys, the other 6 keys can be used as function keys (just like the usual discrete input). The actions of the numeric keys and the function keys are independent and have no effect on each other.
- When execution control "EN" =1, this instruction will scan the numeric keys and function keys in the matrix formed by the 4 input points starting from IN and the 4 output points starting from OT. For the function of the numeric keys and "NKP" output please refer to the TKEY instruction. The function keys maintain the key-in status of the A~F keys in the last 6 relays specified by KL (the first 10 store the key-in status of the numeric keys). If any one of the A~F keys is depressed, FKP (FO1) will set to 1. The OT output points for this instruction must be transistor outputs.
- The biggest number for a 16-bit operand is 4 digits (9999), and for 32-bit operand is 8 digits (99999999). However, there are only 6 function keys (A~F), no matter whether it is a 16-bit or 32-bit operand.

- The instruction in the diagram above uses X0~X3 and Y0~Y3 to form a multiplex key input. It can input numeric values of 8 digits and stores the results in R1R0. The input status of the function keys is stored in M10(A)~M15(F).

FUN 78 <b>D</b> DSW	DIGITAL SWITCH INPUT	FUN 78 <b>D</b> DSW
------------------------	----------------------	------------------------

Ladder symbol

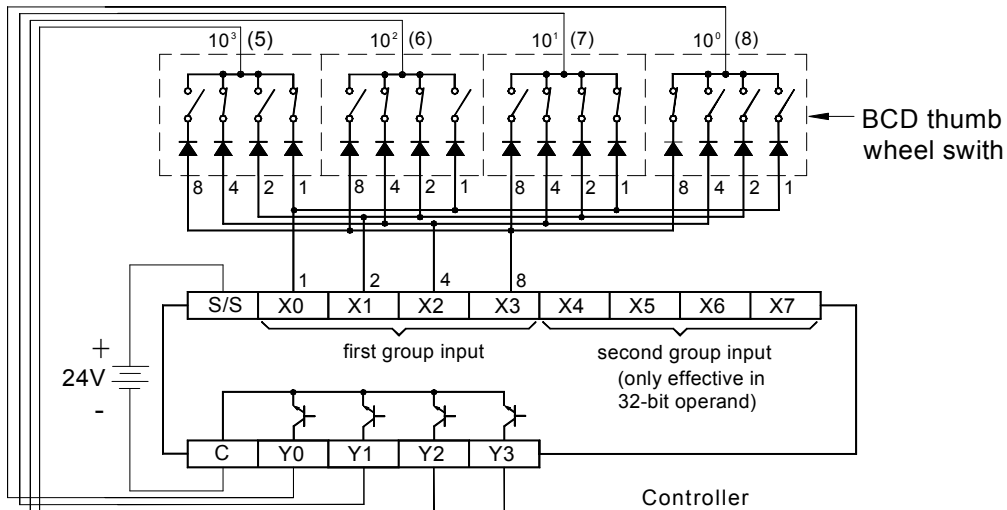

IN : Starting of input for thumb wheel switch  
 OT: Starting of output for multiplexing scan (4 points)  
 D : Register to store readout value  
 WR: Working register, it can't repeat in use (WR & WR+1 for 16-bit operation; WR, WR+1 & WR+2 for 32-bit operation).  
 D may combine with V, Z, P0~P9 to serve indirect addressing application.

IN	○												
OT		○											
D			○	○	○	○	○	○	○	○*	○*	○	○
WR								○			○*	○	

- When input control "EN" =1, this instruction will readout one digit data from the 4 input points starting from IN (IN0~IN3). It takes 4 scans to read out a group of 4-digit BCD values (0000~9999) and store them into D register. With a 32-bit operand, each scan can get 2 digits of data by reading the additional digit from IN4-IN7 and store it in the D+1 register. Each bit of OT0~OT3 will sequentially set to 1 and get the digit data respectively into 10<sup>0</sup>(ones), 10<sup>1</sup>(tens), 10<sup>2</sup>(hundreds), and 10<sup>3</sup>(thousands). As long as EN is 1, controller will scan and read out in continuous cycles. When each complete cycle is finished (i.e. the 4 digit readout of 10<sup>0</sup>~10<sup>3</sup> is completed), the readout completed flag "DN" is set to 1. However, it is only kept for one scan. If any digital readout value is not within the range of 0~9 (BCD), then reading error "ERR" will be set to 1 and the value of that group of digits will be set to 0000.
- The output points must be transistor outputs.

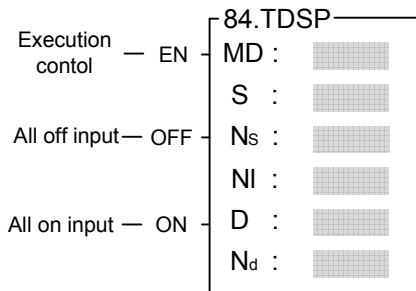

- In this example, when X10 is 1, then the numeric value of the thumb wheel switch (5678 in this example) will be read out and stored into the R0 register.
- The bits (8,4,2,1) with same digit should be connect together and series with a diode (as shown in diagram below).
- With 32-bit operand a set of similar thumb wheel switch may be added to X4~X7 (Y0~Y3 are shared with another group).

FUN 84 TDSP	FBs-7SG DISPLAY MODULE CONVENIENT COMMANDS 7/16-segment display character and number display conversion	FUN 84 TDSP
----------------	--	----------------

- This convenient instruction is used to generate the corresponding display pattern for FBs series 7-segment or 16-segment display panel under the control of FBs-7SG1 or FBs-7SG2 modules (It is a module of non-support in WSZ series).
- When execution control “EN” =1, input “OFF” =0, and input “ON” =0, this instruction will perform the display pattern conversion, where S is the starting address storing the being converted characters, Ns is the pointer to locate the starting character, NI tells the length of being converted characters, and D is the starting address to store the converted result, Nd is the pointer to locate the start of storing.
- There are 4 kinds of operation mode as below:
  - Md=0, display pattern conversion for 16-segment display; the source character is the 8-bit ASCII code, the converted result is the 16-bit display pattern. By the control of M1990, it determines the display direction, where M1990=0, right to left display; M1990=1, left to right display
  - Md=1, without leading zero display conversion for 16-segment display; the source character is the 8-bit ASCII code, the converted result is the 16-bit display pattern without leading zero.
  - Md=2, Non-decoded display pattern conversion for 7-segment display; the source character is the 4-bit nibble code, the converted result is the 8-bit display pattern.
  - Md=3, without leading zero display conversion for 7-segment decoded display; the source character is the 4-bit nibble code, the converted result is the 4-bit display pattern without leading zero. Byte 0 or nibble 0 of S is the 1<sup>st</sup> displaying character, Byte 1 or nibble 1 of S is the 2<sup>nd</sup> displaying character, .....
- Ns operand is the pointer to tell where the displaying character starts.
- NI operand is the character quantity for conversion.

FUN 84 TDSP	FBs-7SG DISPLAY MODULE CONVENIENT COMMANDS 7/16-segment display character and number display conversion	FUN 84 TDSP
----------------	--	----------------

- D operand is the starting address to store the converted display pattern; while Md=0 or 1, one source character of 8-bit ASCII code needs one 16-bit location to store the result; while Md=2, one source character of 4-bit nibble code needs one 8-bit location to store it; while Md=3, one source character of 4-bit nibble code needs one 4-bit location to store it.
- Nd operand is the pointer to tell where is the start to store the converted pattern.
- When inputs “OFF” =1, “ON” =0, and “EN” =0/1, the D operand will be filled with the all OFF pattern according to the operation mode, the Nd pointer, and the quantity of NI.
- When inputs “ON” =1, “OFF” =0/1, and “EN” =0/1, the D operand will be filled with the all ON pattern according to the operation mode, the Nd pointer, and the quantity of NI.
- Data will be converted differently based on the selected mode. The description below is based on Example. In Example, Md=1; S=R0; Ns=0; NI=8; D=R3904; and Nd=8. Data conversion is presented below.

- By employing the temperature module and table editing method to get the current value of temperature and let it be as so called Process Variable (PV); after the calculation of software PID expression, it will respond the error with an output signal according to the setting of Set Point (SP), the error's integral and the rate of change of the process variable. Through the closed loop operation, the steady state of the process may be expected.
- Convert the output of PID calculation to be the time proportional on/off (PWM) output, and via transistor output to control the SSR for heating or cooling process; this is a good performance and very low cost solution.
- Through the analog output module (D/A module), the output of PID calculation may control the SCR or proportional valve to get more precise process control.
- For detailed functional description and usage, please refer to chapter 20 "Temperature Measurement of WSZ-Controller and PID Control" for explanation.

Ladder symbol

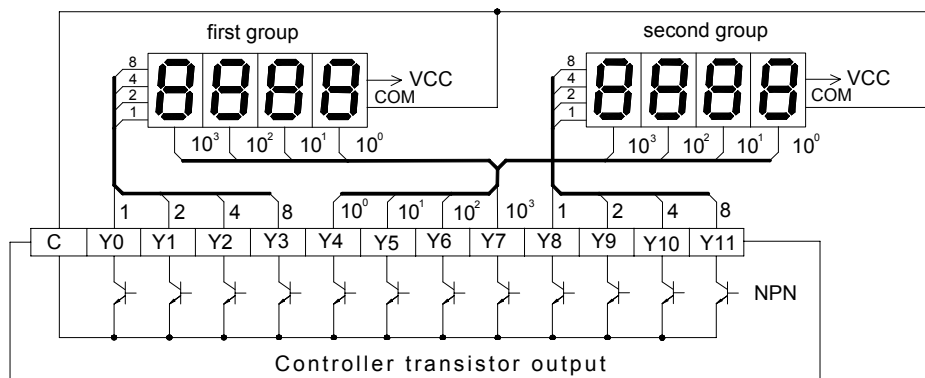

S : Register storing the data (BCD) to be displayed  
 OT : Starting number of scanning output  
 N : Specify signal output and polarity of latch.  
 WR : Working register, it can't repeat in use  
 S may combine with V, Z, P0~P9 to serve indirect addressing application.

Range Operand	Y	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
	Y0 Y240	WX0 WX240	WY0 WY240	WM0 WM1896	WS0 WS984	T0 T255	C0 C255	R0 R3839	R3840 R3903	R3904 R3967	R3968 R4167	R5000 R8071	D0 D4095	16-bit number	V, Z P0~P9
S		○	○	○	○	○	○	○	○	○	○	○	○	○	○
OT	○														
N														0~3	

- When execution control "EN" =1, the 4 nibbles of the S register, from digit 0 to digit 3, are sequentially sent out to the 4 output points, OT0~OT3. While output the digit data, the latch signal of that digit (OT4 corresponds to digit 0, OT5 corresponds to digit 1, etc...) at the same time is also sent out so that the digital value will be loaded and latched into the 7-segment display respectively.
- When in D (32-bit) instruction, nibbles 0~3 from the S register, and nibbles 0~3 from the S+1 register are transferred separately to OT0~OT3 and OT8~OT11. Because they are transferred at the same time, they can use the same latch signal. 16-bit instructions do not use OT8~OT11.
- As long as "EN" remains 1, controller will execute the transfer cyclically. After each transfer of a complete group of numerical values (nibbles 0~3 or 0~7), the output completed flag "DN" will set to 1. However, it will only be kept for 1 scan.

- In this example, when X0=1, the 4 nibbles of R0 will be transferred to the first group 7-segment display in the diagram below. The 4 nibbles of R1 will be transferred to the second group 7-segment display.

FUN 79 **D**  
7SGDL

7-SEGMENT OUTPUT WITH LATCH

FUN 79 **D**  
7SGDL

- WSZ transistor output has both a negative logic transistor output (NPN transistor - when the output status is ON, the terminal voltage of the transistor output is low), and a positive logic transistor output (PNP - when the output status is ON, the terminal voltage of the transistor output is high). Their structure is as follows:

WSZ negative logic output (NPN transistor)

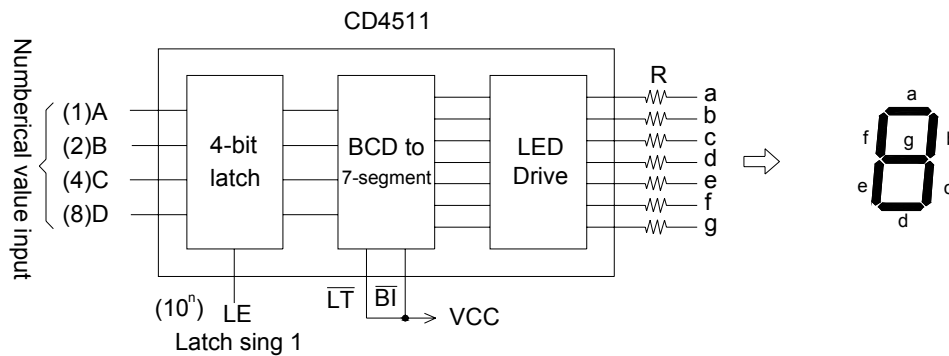

When Yn is "ON", this output voltage is low

WSZ positive logic output (PNP transistor)

When Yn is "ON", Yn's terminal voltage is high

- The data inputs (8,4,2,1) and latch signals of the 7-segment displays on the shelf for positive and negative logic are all available. For example, for numerical value "8", the positive logic input should be 1000, and the negative logic input 0111. Similarly, when the latch signal is 0, the positive logic latch permits the display numerical values to enter through the latch (i.e. be loaded). When the latch signal is 1, the numerical values in the latch are latched (maintained), and with negative logic they are not latched. The following diagram of a CD-4511 7-segment display IC is an example of a positive logic numerical value input with latch.

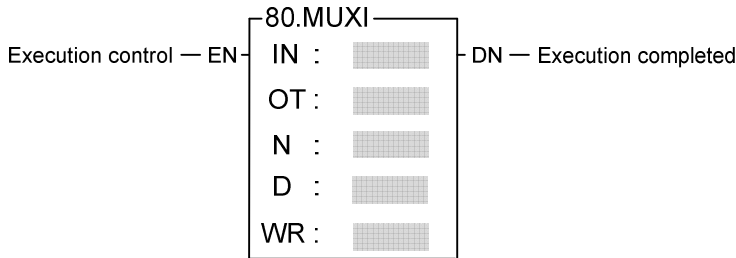

- The controller output and the 7-segment display input polarity can be positive and negative logic. Therefore, the polarities between output and input must be coordinated to get the correct result. This instruction uses N to specify the polarity relation between the controller transistor output, and the 7-segment display. The table below shows all the possibility.

Numerical value input (8~1)	Latch signal ( $10^0$ - $10^3$ )	Value of N
Same	Same	0
	Different	1
Different	Same	2
	Different	3

- In the diagram above, CD4511 is used as an example. If use NPN output, the data input polarity is different to controller, and its latch input polarity is the same as controller, so N value should chosen as 2.

FUN 80 MUXI	MULTIPLEX INPUT	FUN 80 MUXI
----------------	-----------------	----------------

Ladder symbol

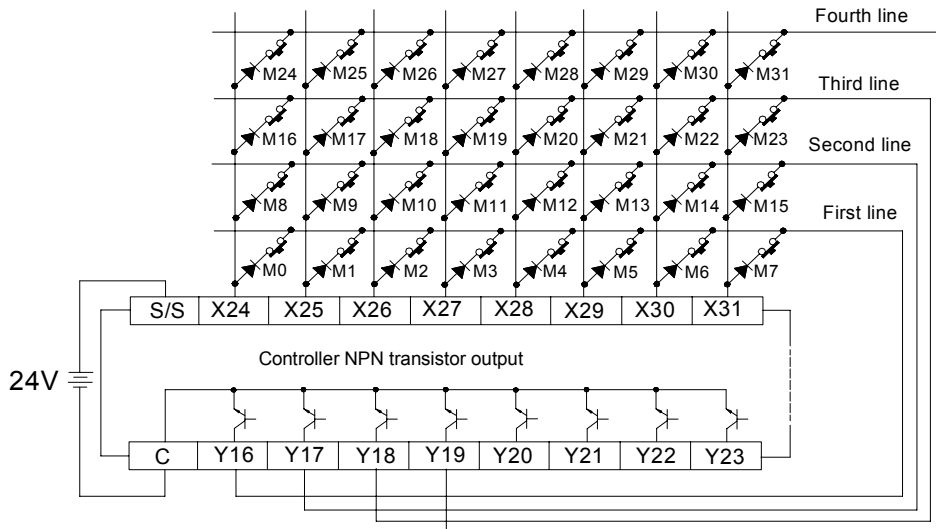

IN : Multiplex input point number  
 OT : Multiplex output point number  
 (must be transistor output point)  
 N : Multiplex input lines (2~8)  
 D : Register for storing results  
 D may combine with V, Z, P0~P9 to serve indirect address application.

- This instruction uses the multiplex method to read out N lines of input status from 8 consecutive input points (IN0~IN7) starting from the input point specified by IN. With this method we can obtain 8xN input status, but only need to use 8 input points and N output points.
- The multiplex scanning method goes through N output points starting from the OT output point. Each scan one of the N bits will set to 1 and the corresponding line will be selected. OT0 responsible for first line, while OT1 responsible for second line, etc. Until it read all the N lines the 8xN status that has been read out is then stored into the register starting at D, and the execution completed flag "DN" is set as 1 (but is only kept for one scanning period).
- With every scan, this instruction retrieves a line for 8 inputs status, so N lines require N scan cycles before they can be completed.

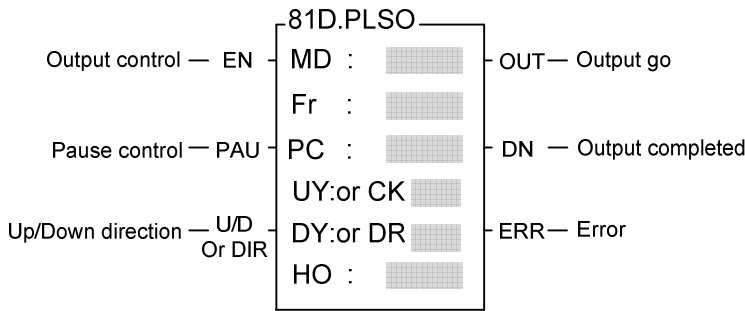

- This example retrieves 4 linesx8 points of input, 32 points status in all. They are stored into the 32-bit register of DWM0 (M0~M31).

<b>FUN 81</b> PLSO	<b>PULSE OUTPUT</b>	<b>FUN 81</b> PLSO

UY · CK	○												
DY · DR	○												
HO			○	○	○	○	○	○	○	○*	○*	○	

- When MD=0, this instruction performs the pulse output control as following:
- Whenever the output control “EN” changes from 0 to 1, it first performs the reset action, which is to clear the output flag “OUT” and “DN” as well as the pulse out register HO to be 0. It gets the pulse frequency and output pulse count values, and reads status of up and down direction “U/D”, so as to determine the direction to be upward or downward. As the reset finished, this instruction will check the input status of pause output “PAU”. No action will be taken if the pause output is 1 (output pause). If the PAU is 0, it will start to output the ON/OFF pulse with 50% duty at the frequency Fr to the UY(U/D=1) or DY(U/D=0) point. It will increment the value of HO register each time when a pulse is output, and will stop the output when HO register’s pulse count is equal to or greater than the cumulative pulse count of PC register and set the output complete flag “DN” to 1. During the time when output pulse is transmitting the output transmitting flag “OUT” will be set to 1, otherwise it will be 0.
- Once it starts to transmit pulse, the output control “EN” should kept to 1. If it is changed to 0, it will stop the pulse sending (output point become OFF) and the flag “OUT” changes back to 0, but the other status or data will keep unchanged. However, when its “EN” changes again from 0 to 1, it will lead to a reset action and treat as a new start; the entire procedure will be restarted again.
- If you want to pause the pulse output and not to restart the entire procedure, the ‘pause output’ “PAU” input can be used to pause it. When “PAU” =1, this instruction will pause the pulse transmitting (output point is OFF, flag “OUT” change back to 0 and the other status or data keeps unchanged). As it waits until the “PAU” changes back from 1 to 0, this instruction will return to the status before it is paused and continues the pulse transmitting output.
- During the pulse transmission, this instruction will keep monitoring the value of pulse frequency Fr and output pulse count PC. Therefore, as long as the pulse output is not finished, it may allow the changing of the pulse frequency and pulse count. However, the up/down direction “U/D” status will be got only once when it takes the reset action (“EN” changes from 0 to 1), and will keep the status until the pulse output completed or another reset occur. That is to say, except that at the very moment of reset, the change of “U/D” does not influence the operation of this instruction.
- The main purpose of this instruction is to drive the stepping motor with the UY (upward) and DY (downward) two directional pulses control, so as to help you control the forward or reverse rotating of stepping motor. Nevertheless, if you need only single direction revolving, you can assign just one of the UY or DY (which will save one output point), and leaving the other output blank. In such case, the instruction will ignore the up/down input status of “U/D”, and the output pulse will send to the output point you assigned.

Advanced Function Instruction

<b>FUN 81 <span style="border: 1px solid black; padding: 0 2px;">D</span></b> PLSO	<b>PULSE OUTPUT</b>	<b>FUN 81 <span style="border: 1px solid black; padding: 0 2px;">D</span></b> PLSO
---	---------------------	---

- When MD=1, the pulse output will reflect on the control output DIR (pulse direction. DIR=1, up; DIR=0, down) and CK (pulse output).
- This instruction can only be used once, and UY (CK) and DY (DR) must be transistor output point on the controller main unit.
- The effective range of output pulse count PC for 16 bits operand is 0~32767. For the 32 bits operand(D instruction), it is 0~2147483647. If the PC value = 0, it is treated as infinite pulse count, and this instruction will transmit pulses without end with HO value and "DN" flag set at 0 all the time. The effective range of pulse frequency (Fr) is 8~2000. If the value PC or Fr exceeds the range, this instruction will not be carried out and the error flag "ERR" will set to 1.

- In this example, the program controls the stepping motor to drive forward for 80 pulses (steps) at the speed of 100Hz first, and then makes it turn reverse for 40 pulses the speed of 50Hz. Make sure that the up/down direction, frequency Fr and the pulse count PC must be set before the reset take action ("EN" changes from 0→1).

FUN 82 PWM	<b>PULSE WIDTH MODULATION</b>	FUN 82 PWM
---------------	-------------------------------	---------------

Ladder symbol

To : Pulse ON width  
(0~32767ms)

Tp : Pulse period  
(1~32676ms)

OT: Pulse output point

S	○													
TI		○	○	○	○	○	○	○	○	○	○	○	○	○
D			○	○	○	○	○	○	○	○	○*	○*	○	

- This instruction uses the interrupt feature of the 8 high speed input points (X0~X7) on the WSZ main unit to detect the frequency of the input signal. Within a specific sampling time (TI), it will calculate the input pulse count for S input point, and indirectly find the revolution speed of rotating devices (such as motors).
- While use this instruction to detect the rotating speed of devices, The application should design to generate more pulse per revolution in order to get better result, but the sum of input frequency of all detected signals should under 5KHz, otherwise the WDT may occur.
- The D register for storing results uses 3 successive 16-bit registers starting from D (D0~D2). Besides D0 which is used to store counting results, D1 and D2 are used to store current counting values and sampling duration.
- When detection control "EN" =1, it starts to calculate the pulse count for the S input point, which can be shown in D1 register. Meanwhile the sampling timer (D2) is switched on and keeps counting until the value of D2 is reach to the sampling period (TI). The final counted value is stored into the D0 register, and then a new counting cycle is started again. The sampling counting will go on repeating until "EN" = 0.
- Because D0 only has 16 bits, so the maximum count is 32767. If the sampling period is too long or the input pulse is too fast then the counted value may exceed 32767, under that case the overflow flag will set to 1, and the counting action will stop.
- Because the sampling period TI is already known and if every revolution of attached rotating device produces "n" pulses, then the following equation can be used to get the revolution.

$$\text{speed : } N = \frac{(D0) \times 60}{n \times TI} \times 10^3 \text{ (rpm)}$$

- In the above example, if every revolution of the rotating device produces 20 pulses (n = 20), and the R0 value is 200, then the revolution per minute speed "N" is as follows.

$$\text{follows : } N = \frac{(200) \times 60}{60 \times 1000} \times 10^3 = 200 \text{ rpm}$$

FUN89 <b>D</b> T1S FUN88 <b>D</b> T.1S FUN87 <b>D</b> T.01S	<b>ACCUMULATIVE TIMER</b>	FUN89 <b>D</b> T1S FUN88 <b>D</b> T.1S FUN87 <b>D</b> T.01S
---	---------------------------	---

- The operation for this instruction is the same as that for the basic timer (T0~T255), except that the basic timer only has a "timing control" input - when its input is 1 it starts timing, and when input is 0 it get clear. Every time the input changes, it starts timing again and is unable to accumulate. Timing with this instruction is only permissible when enable control "EN" =1. With this instruction, when timing control "TIM" is 1, it is the same as a basic timer, but when "TIM" is 0, it does not clear, but keeps the current value. If the timer needs to clear, then change enable control "EN" to 0. When timing control "TIM" is once again to be 1, it will continue to accumulate from the previous value when the timer last paused. In addition, this instruction also has two outputs, "Time up TUP" (when time up it is 1, usually it is 0) and "Time not up" (usually it is 1, when time is up it is 0). Users can utilize input and output combinations to produce timers with various different functions. For example:

- On delay energizing timer:

- This timer's output (Y0 in this example) is normally not energized. When this timer's input control (X0 in this example) is activated (ON), only after delay by 10 sec will output Y0 become energized (ON).

- On delay de-energizing timer:

- The output Y0 of this timer is usually energized. When this timer's input control X0 is on, only after delay by 10 sec will the output become de-energized (OFF).

ACCUMULATIVE TIMER

FUN89 **D** T1S  
 FUN88 **D** T.1S  
 FUN87 **D** T.01S

- Off delay energizing timer:

- This timer's output Y0 is usually de-energized. When this timer's input control X0 is off, only after delay by 10 sec will output Y0 become energized (ON).

- Off delay de-energizing timer:

- This timer's output Y0 is usually energized. When this timer's timing control X0 is off, only after delay by 10 sec will output Y0 become de-energized (OFF).

- The diagram below shows the relation on input and output for the above 4 kinds of timers.

FUN 90 <b>P</b> WDT	WATCHDOG TIMER	FUN 90 <b>P</b> WDT
------------------------	----------------	------------------------

Ladder symbol

N : The watchdog time. The range of N is 5~120, unit in 10ms (i.e. 50ms~1.2 sec) .

- When execution control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, will set the watchdog time to Nx10ms. If the scan time exceeds this preset time, controller will shut down and not execute the application program.
- The WDT feature is designed mainly as a safety consideration from the system view for the application. For example, if the CPU of controller is suddenly damaged, and there is no way to execute the program or refresh I/O, then after the WDT time expired, the WDT will automatically switch off all the I/Os, so as to ensure safety. In certain applications, if the scan time is too long, it may cause safety problems or problems of non-conformance with control requirements. This instruction can used to establish the limitation of the scan time that you require.
- Once the WDT time has been set it will always be kept, and there is no need to set it again on each scan. Therefore, in practice this instruction should use the P instruction.
- Default WDT time is 0.25 sec.
- For the operation principles of WDT please refer to the RSWDT (FUN 91) instruction.

FUN 91  RSWDT	RESET WATCHDOG TIMER	FUN 91  RSWDT
<p style="text-align: center;"><u>Ladder symbol</u></p> <div style="display: flex; justify-content: space-between; align-items: center;"> <div data-bbox="220 430 695 515"> <p>Execution control— EN↑</p> <div style="border: 1px solid black; padding: 5px; display: inline-block;"> <p>91P.</p> <div style="background-color: #cccccc; padding: 2px; display: inline-block;">RSWDT</div> </div> </div> <div data-bbox="868 434 1214 463" style="text-align: right;"> <p>This instruction has no operand.</p> </div> </div>		
<ul style="list-style-type: none"> <li>● When execution control "EN" =1 or "EN↑" ( instruction) changes from 0 to 1, the WDT timer will be reset (i.e. WDT will start timing again from 0).</li> <li>● The functions of WDT have already been described in FUN90 (WDT instruction). The operation principles of watch dog timer are as follows:   <p>The watchdog timer is normally implemented by a hardware one-shot timer (it can not be software, otherwise if CPU fails, the timer becomes ineffective, and safeguards are quite impossible). "One-shot" means that after triggered the timer once, the timing value will immediately be reset to 0 and timing will restart. If WDT has begun timing, and never triggered it again, then the WDT timing value will continue accumulating until it reach the preset value of N, at that time WDT will be activated, and controller will be shut down. If trigger the WDT once every time before the WDT time N has been reached, then WDT will never be activated. Controller can use this feature to ensure the safety of the system. Each time when controller enters into system housekeeping after finished the program scanning and I/O refresh, it will usually trigger WDT once, so if the system functions normally and scan time does not exceed WDT time then WDT is never activated. However, if CPU is damaged and unable to trigger WDT, or the scan time is too long, then there will not be enough time to trigger WDT within the period N, WDT will be activated and will shut off controller.</p> </li> <li>● In some applications, when you set the WDT time (FUN90) to desire, the scan time of your program in certain situations may temporarily exceed the preset time of WDT. This situation can be anticipated and allowed for, and you naturally do not wish controller to shut down for this reason. You can use this instruction to trigger WDT once and avoid the activation of WDT. This is the main purpose of this instruction.</li> </ul>		

FUN 92 HSCTR	HARDWARE HIGH SPEED COUNTER CURRENT VALUE (CV) ACCESS	FUN 92 HSCTR
-----------------	---	-----------------

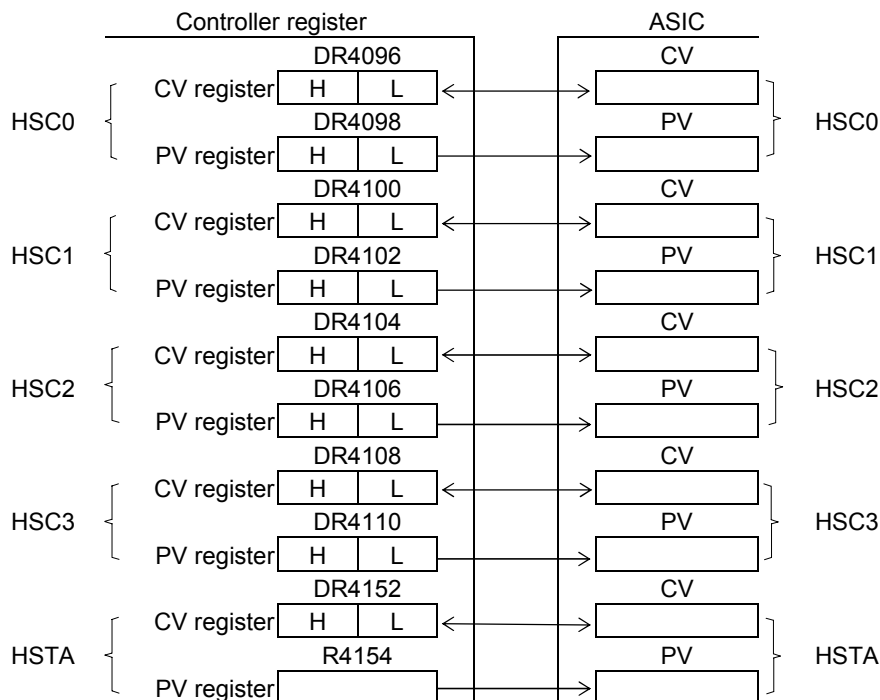

Ladder symbol

CN : Hardware high speed counter number

- 0: HSC0 or HST0
- 1: HSC1 or HST1
- 2: HSC2 or HST2
- 3: HSC3 or HST3
- 4: HSTA

- The HSC0~HSC3 counters of WSZ are 4 sets of 32-bit high speed counter with the variety counting modes such as up/down pulse, pulse-direction, AB-phase. All the 4 high speed counters are built in the ASIC hardware and could perform count, compare, and send interrupt independently without the intervention of the CPU. In contrast to the software high speed counters HSC4~HSC7, which employ interrupt method to request for CPU processing, hence if there are many counting signals or the counting frequency is high, the controller performance (scanning speed) will be degraded dramatically. Since the current values CV of HSC0~HSC3 are built in the internal hardware circuits of ASIC, the user control program (ladder diagram) cannot retrieve them directly from ASIC. Therefore, it must employ this instruction to get the CV value from hardware HSC and put it into the register which control program can access. The following is the arrangement of CV, PV in ASIC and their corresponding CV, PV registers of controller for HSC0~HSC3.

- When readout control “EN” =1 or “EN↑” ( instruction) changes from 0 to 1, will gets the CV value of HSC designated by CN from ASIC and puts into the HSC corresponding CV register (i.e. the CV of HSC0 will be read and put into DR4096 or the CV of HSC1 will be read and put into DR4100).
- Although the PV within ASIC has a corresponding PV register in CPU, but it is not necessary to access it (actually it can't be) for that the PV value within ASIC comes from the PV register in CPU.
- HSTA is a timer, which use 0.1ms as its time base. The content of CV represents elapse time counting at 0.1ms tick.
- For detailed applications, please refer to Chapter 10 “WSZ-Controller High-Speed Counter and Timer”.

FUN 93 <b>P</b> HSCTW	HARDWARE HIGH SPEED COUNTER CURRENT VALUE AND PRESET VALUE WRITING	FUN 93 <b>P</b> HSCTW
--------------------------	---	--------------------------

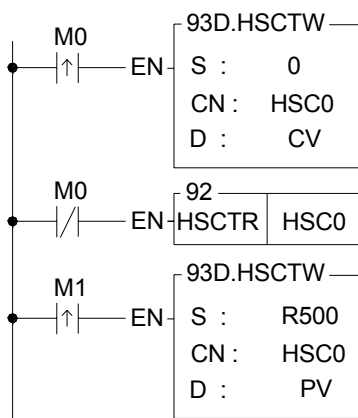

S : The source data for writing

CN : Hardware high speed counter to be written  
 0: HSC0 or HST0  
 1: HSC1 or HST1  
 2: HSC2 or HST2  
 3: HSC3 or HST3  
 4: HSTA

D : Write target (0 represents CV, 1 represents PV)

- Please refer first to FUN92 for the relation between the CV or PV value of HSC0~HSC3 and HSTA within ASIC and their corresponding CV and PV registers in CPU.
- When write control “EN”=1 or “EN↑” (**P** instruction) changes from 0 to 1, it writes the content of CV or PV register of high speed counter designed by CN of CPU, to the corresponding CV or PV of HSC within ASIC.
- It is quit often to set the PV value for most application program. When the count value reaches the preset value, the counter will send out interrupt signal immediately. By way of the interrupt service program, you can implement different kinds of precision counting or positioning control.
- When there is an interrupt of power supply for WSZ-controller, the values of current value registers CV of HSC0~HSC3 within ASIC will be read out and wrote into the HSC0~HSC3 CV registers (with power retentive function) of CPU automatically. When power comes up, these CV values will be restored to ASIC. However, if your application demands that when power is on, the values should be cleared to 0 or begin counting from a certain value, then you have to use this instruction to write in the CV value for HSC in ASIC.
- When a non-zero value is written into the PV register of HSTA, it will cause the HSTAI interrupt subroutine to be executed for every PV x 0.1ms.
- For detailed applications, please refer Chapter 10 “WSZ-Controller High-Speed Counter and Timer”.

- As the program in the left diagram, when M0 changes from 0→1, it clears the current value of HSC0 to 0, and writes into ASIC hardware through FUN93.
- When M0 is 0, it reads out the current counting value.
- When M1 changes from 0→1, it moves DR500 to DR4098, and writes the preset value into ASIC hardware through FUN93.
- Whenever the current value equals to the DR500, The HSC0I interrupt sub program will be executed.

FUN 94 ASCWR	ASCII FILE WRITE	FUN 94 ASCWR

MD				○
S	○	○	○	
Pt	○	○*	○	

- When MD=0 and output control “EN” changes from 0 to 1, it transmits the ASCII data which starting from S to the communication port 1 (Port1), until reach end of file.
- S file data can be edited with the programming software WinProladder (please refer to the explanation of chapter 14 “The Application of ASCII file output function”). If necessary the user can also edit the ASCII file directly by change the value of data registers. However, the edited data must be follow the ASCII file format (the details described in chapter 14), otherwise, this instruction will halt the transmission and set the error flag “ERR” to 1. If the entire file is correctly and successfully transmitted, then the output is completed and “DN” is set to 1.
- The control input of this instruction is of positive edge triggered. Once “EN” changes from 0 to 1 then this instruction starts the execution, until finished the transmission of the entire file then the execution is completed. During the transmission, the action flag “ACT” will be kept at 1 all the time. Only when output pause, error, or abort occurs, will it change back to 0.
- This instruction can be repeatedly used, but only one will be executed (transmit data) at any certain time. It is the obligation of user to make sure the right execution sequence.
- While this instruction is in execution, if the pause “PAU” is 1, this instruction will pause the transmission of file data. It will resume transmission when the pause “PAU” backs to 0.
- While this instruction is in execution, if the abort “ABT” is 1, this instruction will abandon the transmission of file data, and then it is able to take next instruction for execution.
- This instruction can only be used for the communication port1.
- For detail applications, please refer to chapter 14 “The Application of ASCII file output function”.

- When execution control "EN"=0, current output value (Rc) will be 0 immediately; the output indicators ACC=0 and DEC=0.
- When execution control "EN"=1, this instruction being executed; it will output current value (Rc) first, and then compare the target output value (Rt) with current output value (Rc) every scan; if the target output value is greater than current output value, the current output will be increased according to the rate, which is decided by the settings of acceleration time (Ta) and maximum output (Om), till current output value is equal to the target output value (ACC=1 during this time); if the target output value is less than current output value, the current output will be decreased according to the rate, which is decided by the settings of deceleration time (Td) and maximum output (Om), till current output value is equal to the target output value (DEC=1 during this time).
- If the setting value of target output (Rt) is greater than maximum output (Om), the output value will be clamped by the maximum value.
- It can have smooth activity for acceleration and deceleration control via the execution of this instruction by using current output value (Rc) for analog output (R3904~R3967).
- The setting value of target output (Rt) needs to stay two scan times at least for proper operation.
- It needs 4 registers for working, they can not be repeated in use ◦
- This instruction is for positive value operation, but it also can have negative output by short and easy application program for help. Please see example 2.

FUN98 RAMP2	TRACKING TYPE RAMP FUNCTION FOR D/A OUTPUT	FUN98 RAMP2
----------------	--	----------------

**Example 1 : Positive output for ACC/DEC control**

- D10 : Setting of maximum output, it is 16383
- D0 : The acceleration time for the output from 0 up to maximum, it is 30000ms
- D1 : The deceleration time for the output from maximum down to 0, it is 20000ms
- D100 : Setting of target output value, it is 8192
- R3904 : Register of current output, it is used for analog output
- D1000~D1003 : Working registers

Description : When M0=0, current output value is 0 immediately (No ramp).

When M0=1, it will output the value of R3904 first; and then compare the target output value (D100) with current output value (R3904) every scan; if  $D100 > R3904$ , the current output value of R3904 will be increased according to the rate of  $16383/30000$  ( $Om=16383, Ta=30000$ ), till  $R3904=D100$  (ACC=1 during this time); if  $D100 < R3904$ , the current output value of R3904 will be decreased according to the rate of  $16383/20000$  ( $Om=16383, Td=20000$ ), till  $R3904=D100$  (DEC=1 during this time).

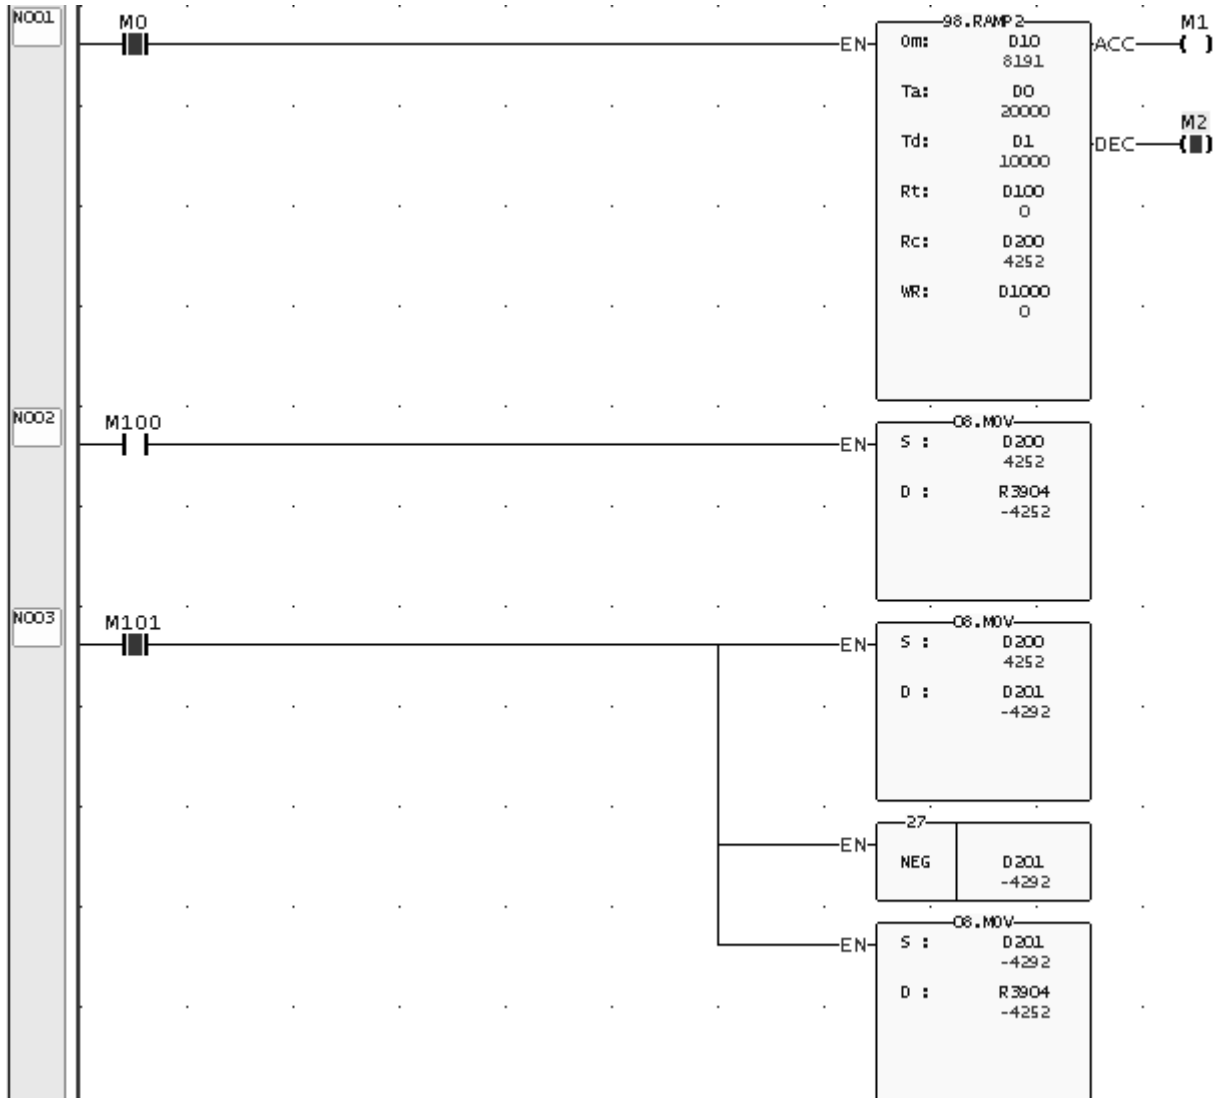

FUN98  
RAMP2

TRACKING TYPE RAMP FUNCTION FOR D/A OUTPUT

FUN98  
RAMP2

Example 2 : Both positive and negative output for ACC/DEC control

- D10 : Setting of maximum output, it is 8191
- D0 : The acceleration time for the output from 0 up to maximum, it is 20000ms
- D1 : The deceleration time for the output from maximum down to 0, it is 10000ms
- D100 : Setting of target output value, it is 0
- D200 : Register of current output, it is used for analog output
- D1000~D1003 : Working registers

Description : When M0=0, current output value is 0 immediately (No ramp).

When M0=1, it will output the value of D200 first; and then compare the target output value (D100) with current output value (D200) every scan; if  $D100 > D200$ , the current output value of D200 will be increased according to the rate of 8191/20000 ( $Om=8191, Ta=20000$ ), till  $D200=D100$  (ACC=1 during this time); if  $D100 < D200$ , the current output value of D200 will be decreased according to the rate of 8191/10000 ( $Om=8191, Td=10000$ ), till  $D200=D100$  (DEC=1 during this time).

M100=1, positive output control; M101=1, negative output control.

The target output (D100) is always positive value from 0~65535.

FUN 95 RAMP	RAMP FUNCTION FOR D/A OUTPUT	FUN 95 RAMP

95.RAMP

Input control — EN	Tn :		ERR —
	PV :		
Pause control — PAU	SL :		ASL —
	SU :		
Up/Down output — U/D	D :		ASU —

Tn : Timer for ramp function  
 PV : Preset value of ramp timer (the unit is 0.01 sec) or the increment / decrement value of every 0.01 sec  
 SL : Lower limit value (ramp floor value of up or ramp ceiling value of down).  
 SU : Upper limit value (ramp floor value of down or ramp ceiling value of up).  
 D : Register storing current ramping value.  
 D+1 : Working register  
 SU, SL could be positive or negative value when incorporate with AO module application.

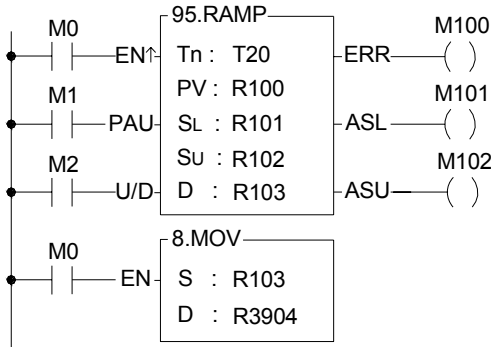

Range Operand	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K
	WX0 WX240	WY0 WY240	WM0 WM1896	WS0 WS984	T0 T255	C0 C255	R0 R3839	R3840 R3903	R3904 R3967	R3968 R4167	R5000 R8071	D0 D4095	16-bit +/- number
Tn					○								
PV	○	○	○	○	○	○	○	○	○	○	○	○	○
SL	○	○	○	○	○	○	○	○	○	○	○	○	○
SU	○	○	○	○	○	○	○	○	○	○	○	○	○
D		○	○	○	○	○	○	○	○	○*	○*	○	

**Description**

- Tn must be a 0.01 sec time base timer and never used in other part of program.
- When M1974=0, PV is the preset value of ramp timer. Its unit is 10ms (0.01 sec).
- When M1974=1, PV is the ramp value to increment / decrement every 10ms.
- When input control “EN” changes from 0 to 1, it first reset the timer Tn to 0.  
 When “U/D”=1 it will load the value of SL to register D. And when M1974 =0 it will be increased by SU-SL / PV every 0.01 sec or when M1974 =1 it will increase by PV every 0.01 sec. When the D value reaches the SU value the output “ASU” =1.  
 When “U/D”=0 it will load the value of SU to register D. When M1974 =0 it will be decreased by SU-SL / PV every 0.01 sec or when M1974 = 1 it will be decreased by PV every 0.01 sec. When the D value reaches the SL value the output “ASL” =1.
- The ramping direction(U/D) is determined at the time when input control “EN” changes from 0 to 1. After the output D start to ramp, the change of U/D is no effect.
- If it is required to pause the ramping action, it must let the input control “PAU” =1; when “PAU”=0, and the ramping action is not completed, it will continue to complete the ramping action.
- The value of SU must be larger than SL, otherwise the ramp function will not be performed, and the output “ERR” will set to 1.
- This instruction use the register D to store the output ramping value; if the application use the D/A module to send the speed command, then speed command can be derived from the RAMP function to get a more smooth movement.
- In addition to use register D to store the ramping value, this instruction also used the register D+1 to act as internal working register; therefore the other part of program can not use the register D+1.

FUN 95 RAMP	RAMP FUNCTION FOR D/A OUTPUT	FUN 95 RAMP
----------------	------------------------------	----------------

**Program example**

Move the ramping value to AO output register R3904.

T20: Ramp timer (timer with 0.01 sec time base)

R100: preset value of ramp timer (M1974=0, the unit is 0.01 sec).

ramp value to increment / decrement every 10ms (M1974=1)

R101: Lower limit value. (Ramp floor value of up or ramp ceiling value of down)

R102: Upper limit value. (Ramp floor value of down or ramp ceiling value of up)

R103: Register storing current ramp value.

R104: Working register

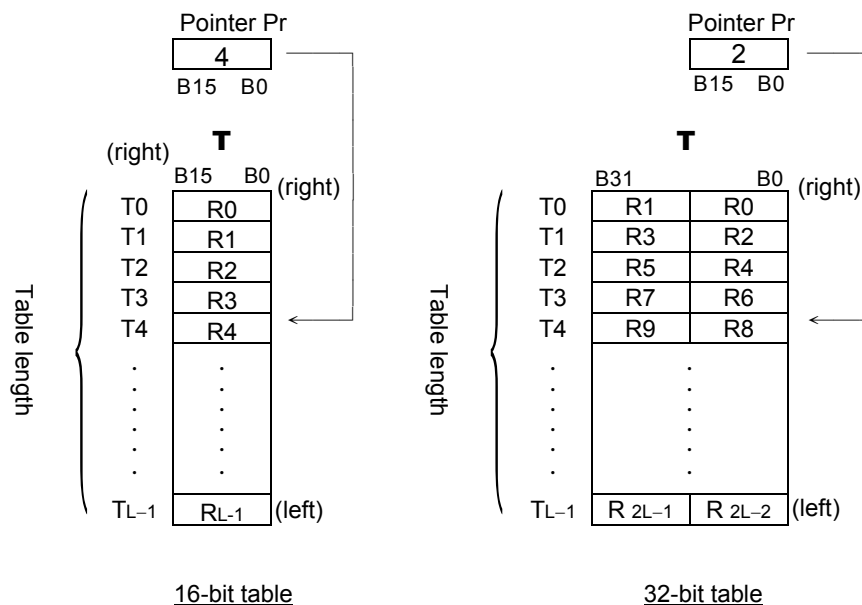

- If M1974=0, When input control M0 changes from 0→1, it first reset the timer T20 to 0. If M2=1, it will load the R101 (lower limit) value into the R103, and it will increase the output with fixed value (R102-R101 / R100) for every 0.01 second and stores it to register R103. When the T20 timer going up to the preset value R100, the output value equals to R102, and the output M102 will set to 1. If M2=0, will load the R102 (upper limit) value into the R103, and it will decrease the output amount with fixed ratio (R102-R101 / R100) for every 0.01 second and store it to register R103. The T20 timer going up to the preset value R100, the output value equals to R101, and the output M101 will set to 1.
- M1=1, pause the ramping action.
- The value of R102 must be greater than R101, otherwise the ramp action will not be performed, and the output M100 will set to 1.

## Table Instructions

Fun No.	Functionality	Fun No.	Functionality
100	Register to table data move	107	Table fill
101	Table to register data move	108	Table shift
102	Table to table data move	109	Table rotate
103	Block table move	110	Queue
104	Block table swap	111	Stack
105	Register to table search	112	Block compare
106	Table to table compare	113	Data Sort

- A table consists of 2 or more consecutive registers (16 or 32 bits). The number of registers that comprise the table is called the table length (L). The operation object of the table instructions always takes the register as unit (i.e. 16 or 32 bits data).
- The operation of table instructions are used mostly for data processing such as move, copy, compare, search etc, between tables and registers, or between tables. These instructions are convenient for application.
- Among the table instructions, most instructions use a pointer to specify which register within a table will be the target of operation. The pointer for both 16 and 32-bit table instructions will always be a 16-bit register. The effective range of the pointer is 0 to L-1, which corresponds to registers T<sub>0</sub> to T<sub>L-1</sub> (a total of L registers). The table shown below is a schematic diagram for 16-bit and 32-bit tables.
- Among the table operations, shift left/right, rotate left/right operations include a movement direction. The direction toward the higher register is called left, while the direction toward the lower register is called right, as shown in the diagram below.

FUN100 **D P** REGISTER TO TABLE MOVE FUN100 **D P**  
R→T R→T

Ladder symbol

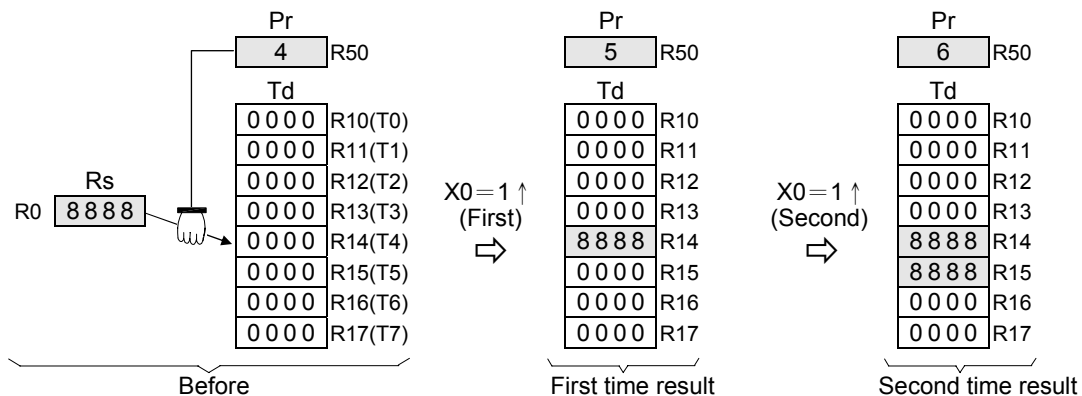

Rs : Source data can be constant or register.  
Td : Source register for destination table  
L : Length of destination table  
Pr : Pointer register  
Rs, Td can associate with V, Z, P0~P9 index register as indirect addressing.

Range Ope- rand	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
	WX0   WX240	WY0   WY240	WM0   WM1896	WS0   WS984	T0   T255	C0   C255	R0   R3839	R3840   R3903	R3904   R3967	R3968   R4167	R5000   R8071	D0   D4095	16/32-bit +/- number	V, Z   P0~P9
Rs	○	○	○	○	○	○	○	○	○	○	○	○	○	○

L							○				○*	○	2~2048	
Pr		○	○	○	○	○	○		○	○*	○*	○		

- When move control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, the contents of the source register Rs will be written onto the register Tdpr indicated by the pointer Pr within the destination table Td (length is L). Before executing, this instruction will first check the pointer clear "CLR" input signal. If "CLR" is 1, it will first clear the pointer Pr, and then carry out the move operation. After the move has been completed, it will then check the Pr value. If the Pr value has already reached L-1 (point to the last register in the table) then it will only set the move-to-end flag "END" to 1, and finish execution of this instruction. If the Pr value is less than L-1, then it must again check the pointer increment "INC" input signal. If "INC" is 1, then Pr value will be also increased. Besides, pointer clear "CLR" is able to operate independently, without being influenced by other input.
- The effective range of the pointer is 0 to L-1. Beyond this range, the pointer error "ERR" will be set to 1, and this instruction will not be performed.

- The example at left at the very beginning pointer Pr =4, the entire content of table Td is 0, and the Rs value is 8888. The diagram below shows the operation results when X1 have the transition of 0 to 1 twice.
- Because INC is 1, Pr will increase by 1 each time the instruction is executed.

FUN101 **D P** T→R TABLE TO REGISTER MOVE FUN101 **D P** T→R

Ladder symbol

Ts : Source table starting register

Pr		○	○	○	○	○	○		○	○*	○*	○		

- When move control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, the register Tspr pointed by pointer Pr within the source table will be moved to a register Tdpr, which also pointed by the pointer Pr in the destination table. Before execution, it will first check the input signal of pointer clear "CLR". If "CLR" is 1, it will first clear Pr to 0 and then do the move (in this case Ts0→Td0). After the move action has been completed it will then check the value of pointer Pr. If the Pr value has already reached L-1 (point to the last register on the table), then it will set the move-to-end flag "END" to 1 and finish executing of this instruction. If the Pr value is less than L-1, it will check the status of "INC". If "INC" is 1, then the Pr value will be increased by 1 before execution. Besides, pointer clear "CLR" can execute independently, and will not be influenced by other input.
- The effective range of the pointer is 0 to L-1. Beyond this range, the pointer error flag "ERR" will be set to 1, and this instruction will not be carried out.

- The diagram at left below is the status before execution. When X0 from 0 to 1, the content of R5 in Ts table will copy to R15 and pointer R20 will be increased by 1.

FUN103 **D** **P** **BT\_M** BLOCK TABLE MOVE FUN103 **D** **P** **BT\_M**

Ladder symbol

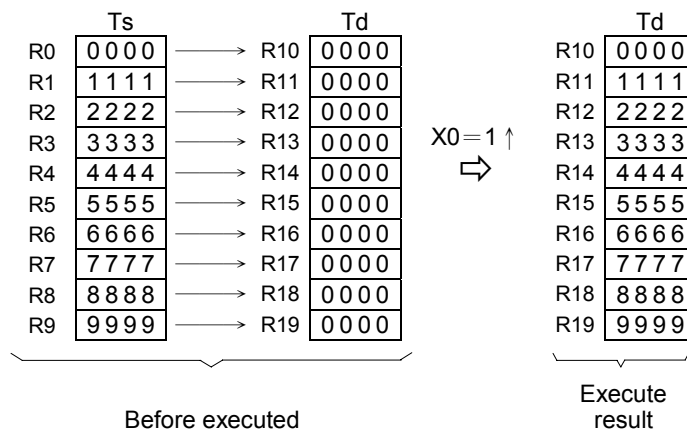

Ts : Starting register for source table  
 Td : Starting register for destination table  
 L : Lengths of source and destination tables  
 Ts, Td may combine with V, Z, P0~P9 to serve indirect address application.

Range Operand	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
	WX0   WX240	WY0   WY240	WM0   WM1896	WS0   WS984	T0   T255	C0   C255	R0   R3839	R3840   R3903	R3904   R3967	R3968   R4167	R5000   R8071	D0   D4095	2   256	V, Z   P0~P9
Ts	○	○	○	○	○	○	○	○	○	○	○	○		○
Td		○	○	○	○	○	○			○*	○*	○		○
L							○				○*	○	○	

- In this instruction the source table and destination table are the same length. When this instruction was executed all the data in the Ts table is completely copied to Td. No pointer is involved in this instruction.
- When move control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, all the data from source table Ts (length L) is copied to the destination table Td, which is the same length.
- One table is completely copied every time this instruction is executed, so if the table length is long, it will be very time consuming. In practice, P modifier should be used to avoid time waste caused by each scan repeating the same movement action.

- The diagram at left below is the status before execution. When X0 from 0 to 1, the content of R0~R9 in Ts table will copy to R10~R19.

FUN104 <b>D</b> <b>P</b> T_SWP	BLOCK TABLE SWAP	FUN104 <b>D</b> <b>P</b> T_SWP

- When search control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, will search from the first register of Table Ts (when "FHD" =1 or Pr value has reached L-1), or from the next register (Tspr + 1) pointed by the pointer within the table ("FHD" =0, while Pr value is less than L-1) to find the first data different with Rs (when D/S =1) or find the first data the same with Rs (when D/S =0). If it find a data match the condition it will immediately stop the search action, and the pointer Pr will point to that data and found objective flag "FND" will set to 1. When the searching has searched to the last register of the table, the execution of the instruction will stop, whether it was found or not. In that case the search-to-end flag "END" will be set to 1 and the Pr value will stop at L-1. When this instruction next time is executed, Pr will automatically return to the head of the table (Pr =0) before the search begin.
- The effective range of Pr is 0 to L-1. If the value exceeds this range then the pointer error flag "ERR" will change to 1, and this instruction will not be carried out.

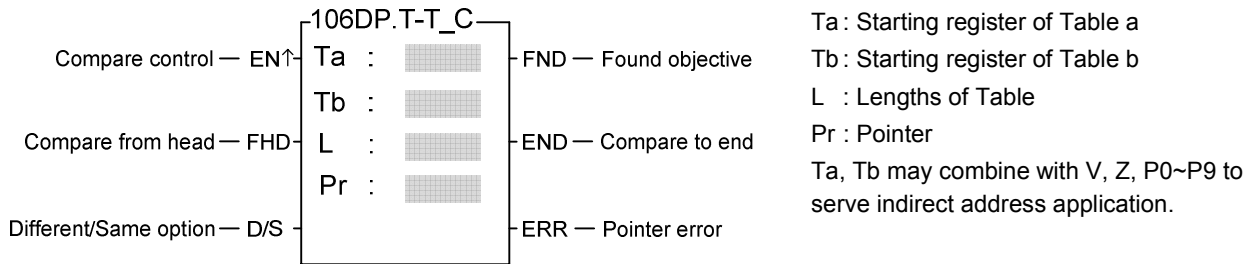

- The instruction at left is searching the table for a register with the value 5555 (because D/S =0, it is searching for same value). Before execution, the pointer point to R2, but the starting point of the search is Pr + 1 (i.e. it starts from R3). After X0 has transition from 0 to 1 3 times, the results of each search may be obtained as shown in the diagram below.

FUN106 T-T\_C
TABLE TO TABLE COMPARE
FUN106 T-T\_C

Ladder symbol

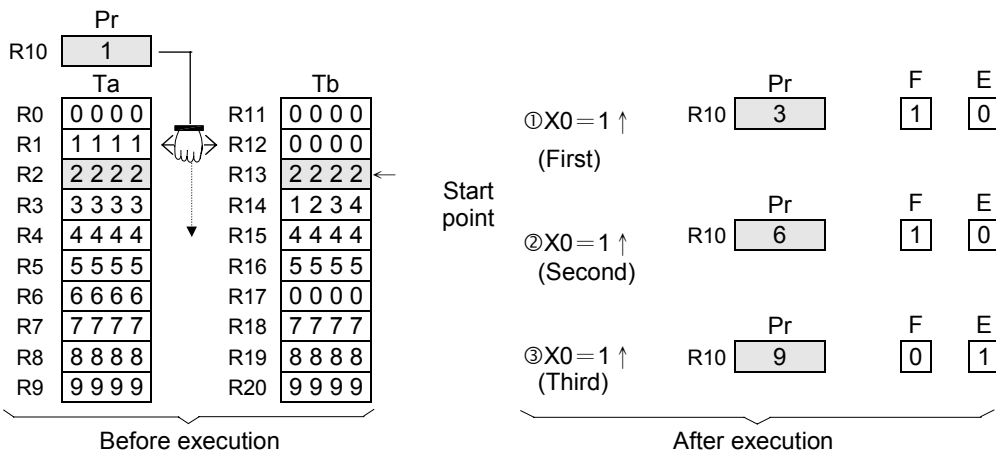

Range Ope- rand	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
	WX0	WY0	WM0	WS0	T0	C0	R0	R3840	R3904	R3968	R5000	D0	2	V, Z
	WX240	WY240	WM1896	WS984	T255	C255	R3839	R3903	R3967	R4167	R8071	D4095	256	P0~P9
Ta	○	○	○	○	○	○	○	○	○	○	○	○		○
Tb	○	○	○	○	○	○	○	○	○	○	○	○		○
L							○				○*	○	○	
Pr		○	○	○	○	○	○		○	○*	○*	○		

- When compare control "EN" =1 or "EN↑" () instruction changes from 0 to 1, then starting from the first register in the tables Ta and Tb (when "FHD" =1 or Pr value has reached L-1) or starting from the next pair of registers (Tapr+1 and Tbpr+1) pointed by Pr ("FHD" =0, while Pr is less than L-1), this instruction will search for pairs of registers with different values (when "D/S" =1) or the same value (when "D/S" =0). When search found (either different or the same), it will immediately stop the search and the pointer Pr will point to the register pairs met the search criteria. The found flag "FND" will be set to 1. When it has searched to the last register of the table, the instruction will stop executing. Whether it found or not. The compare-to-end flag "END" will be set to 1, and the pointer value will stop at L-1. When this instruction is executed next time, Pr will automatically return to the head of the table to begin the search.
- The effective range of Pr is 0 to L-1. As this will affect the result of the search, the Pr value should not be changed by other programs during the operation. If the Pr value not in the effective range, the pointer error flag "ERR" will be set to 1, and this instruction will not be carried out.

- The instruction at left starts from the register next to the register pointed by the pointer (because "FHD" is 0) to search for register pairs with different data (because "D/S" is 1) within the 2 tables. At the very beginning, Pr points to Ta1 and Tb1. There are 3 different pairs of data at the position 1, 3, 6 of the table. However, it does not compare from the beginning, and this instruction will start searching from position 3 downwards. After X0 has changed 3 times from 0 to 1, the results are shown in the diagram below.

FUN107 <b>D</b> <b>P</b> T_FIL	TABLE FILL	FUN107 <b>D</b> <b>P</b> T_FIL
-----------------------------------	------------	-----------------------------------

Ladder symbol

Rs : Source data to fill, can be a constant or a register

Td : Starting register of destination table

L : Table length

Rs, Td may combine with V, Z, P0~P9 to serve indirect address application.

Range	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR

L							○				○*	○	○	

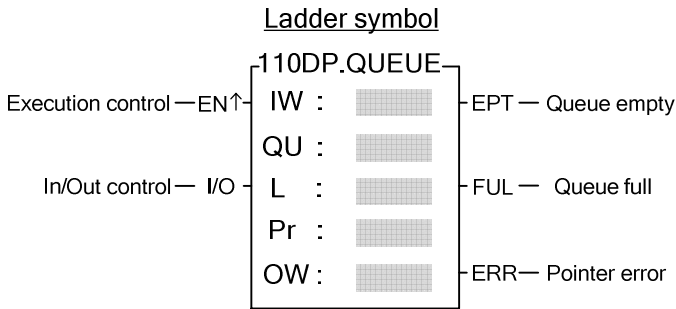

- When rotate control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, the data from the table of Ts will be rotated 1 position to the left (when "L/R" =1) or 1 position to the right (when "L/R" =0). The results of the rotation will then be written onto table Td.

- In the program at left, Ts and Td is the same table. The table after rotation will write back to itself. It first perform one left rotation (let X1 =1, and X0 go from 0 to 1), and then performs one right rotation (let X1 =0, and X0 go from 0 to 1). The results are shown at right in the diagram below.

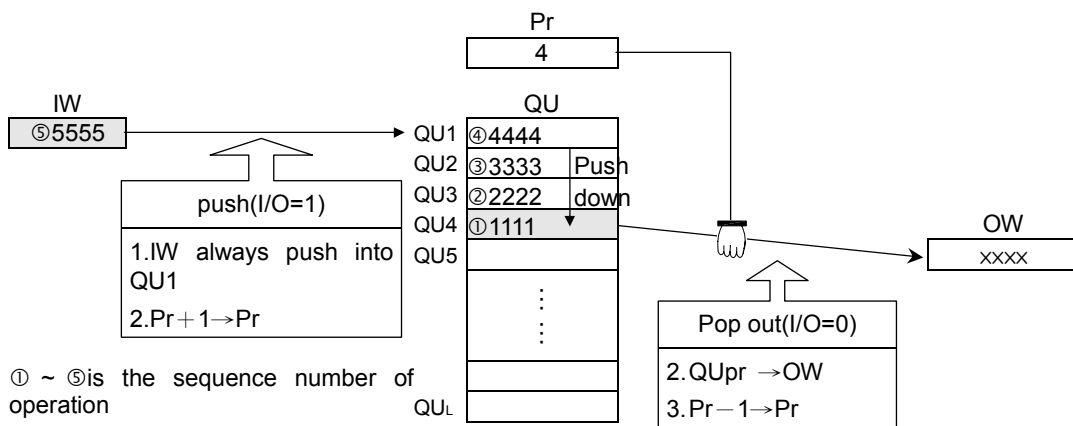

FUN110 QUEUE	QUEUE	FUN110 QUEUE
-----------------	-------	-----------------

IW : Data pushed into queue, can be a constant or a register  
 QU : Starting register of queue  
 L : Size of queue  
 Pr : Pointer register  
 OW : Register accepting data popped out from queue  
 QU may combine with V, Z, P0~P9 to serve indirect address application.

Range Operand	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
	WX240	WY240	WM1896	WS984	T255	C255	R3839	R3903	R3904	R3967	R4167	R5000	R8071	D4095
IW	○	○	○	○	○	○	○	○	○	○	○	○	○	○
QU		○	○	○	○	○	○	○	○	○	○	○*	○	○
L							○					○*	○	2~256
Pr		○	○	○	○	○	○		○	○*	○*	○		
OW		○	○	○	○	○	○		○	○*	○*	○		

- Queue is also a kind of table. It is different from ordinary table in that its queue register numbers go from 1 to L and not from 0 to L-1. In other words QU<sub>1</sub>~QU<sub>L</sub> respectively correspond to pointers Pr =1 to L, and Pr =0 is used to show that the queue is empty.
- Queue is a first in first out (FIFO) device, i.e. - the data that first pushed into the queue will be the first to pop out from the queue. A queue is comprised of L consecutive 16 or 32 bits registers (D instruction) starting from the QU register, as in the diagram below:

- When execution control "EN" =1 or "EN↑" (P instruction) changes from 0 to 1, the status of in/out control "I/O" determines whether the IW data will be pushed into the queue (when "I/O" =1) or be popped out and transferred to OW (when "I/O" =0). As shown in the diagram above, the IW data will always be pushed into the first (QU1) register of the queue. After it has been pushed in, Pr will immediately be increased by 1, so that the pointer can always point to the first data that was pushed into the queue. When it is popped out, the data pointed by Pr will be transferred directly to OW. Pr will be reduced by 1, so that it still point to the first data remained in the queue.

FUN110 QUEUE	QUEUE	FUN110 QUEUE
-----------------	-------	-----------------

- If no data has yet been pushed into the queue or the pushed in data has already been popped out (Pr = 0), then the queue empty flag will be set to 1. In this case, even if there is further popping out action, this instruction will not be executed. If data is only pushed in and not popped out, or pushed in is more than that popped out, then the queue finally becomes full (pointer Pr indicates the QU<sub>L</sub> position), and the queue full flag is changed to 1. In this case, if there is more pushing in action, this instruction will not execute. The pointer for this instruction is used during access of the queue, to indicate the data that was pushed in the earliest. Other programs should not be allowed to change it, or else an operation error will be created. If there is a specific application, which requires the setting of a Pr value, then its permissible range is 0 to L (0 means empty, and 1 to L respectively correspond to QU<sub>1</sub> to QU<sub>L</sub>). Beyond this range, the pointer error flag "ERR" will be set as 1, and this instruction will not be carried out.

- The program at left assumes the queue content is the same with the queue at preceding page. It will first perform queue push operation, and then perform pop out action. The results are shown below. Under any circumstance, Pr always point to the first (oldest) data that was remained in queue.

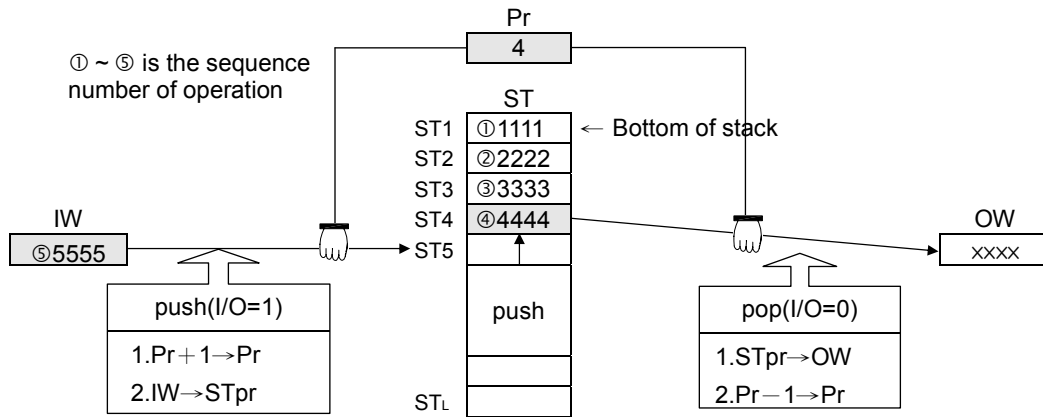

FUN111 <b>D</b> <b>P</b> STACK	STACK	FUN111 <b>D</b> <b>P</b> STACK
-----------------------------------	-------	-----------------------------------

IW : Data pushed into stack, can be a constant or a register.  
 ST : Starting register of stack  
 L : Size of stack  
 Pr : Pointer register  
 OW : Register accepting data popped out from stack.  
 ST may combine with V, Z, P0~P9 to serve indirect address application.

Range Operand	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
	WX0   WX240	WY0   WY240	WM0   WM1896	WS0   WS984	T0   T255	C0   C255	R0   R3839	R3840   R3903	R3904   R3967	R3968   R4167	R5000   R8071	D0   D4095	16/32-bit +/- number	V, Z   P0~P9
IW	○	○	○	○	○	○	○	○	○	○	○	○	○	
ST		○	○	○	○	○	○		○	○*	○*	○		○
L							○				○*	○	2~256	
Pr		○	○	○	○	○	○		○	○*	○*	○		
OW		○	○	○	○	○	○		○	○*	○*	○		

- Like queue, stack is also a kind of table. The nature of its pointer is exactly the same as with queue, i.e. Pr =1 to L, which corresponds to ST<sub>1</sub> to ST<sub>L</sub>, and when Pr =0 the stack is empty.
- Stack is the opposite of queue, being a last in first out (LIFO) device. This means that the data that was most recently pushed into the stack will be the first to be popped out of the stack. The stack is comprised of L consecutive 16 or 32-bit (D instruction) registers starting from ST, as shown in the following diagram:

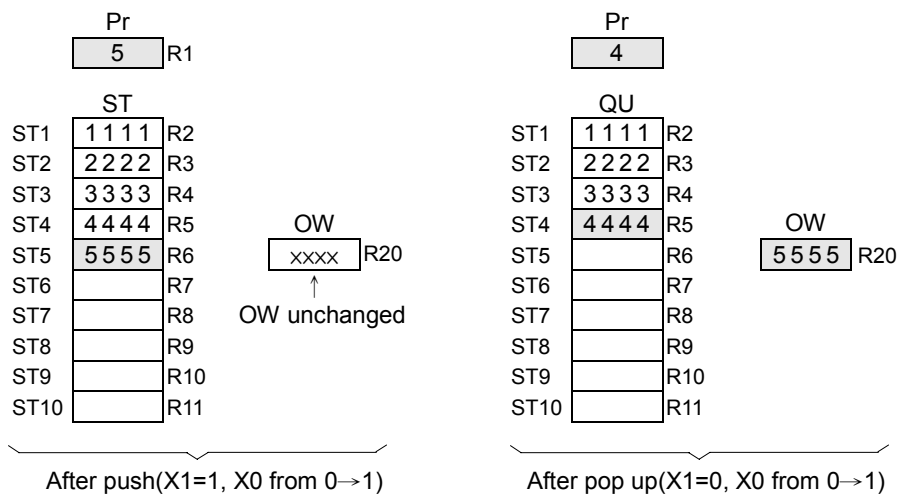

- When execution control "EN" =1 or "EN↑" (P instruction) changes from 0 to 1, the status of in/out control "I/O" determines whether the IW data will be pushed into the stack (when "I/O" =1), or the data pointed by Pr within the stack (the data most recently pushed into the stack) will be moved out and transferred to OW (when "I/O" =0). Note that the data pushed in is stacking, so before pushed in, Pr will increased by 1 to point to the top of the stack then the data will be pushed in. When it is popped out, the data pointed by pointer Pr (the most recently pushed in data) will be transferred to OW. After then Pr will be decreased by 1. Under any circumstances, the pointer Pr will always point to the data that was pushed into the stack most recently.

FUN111 STACK	STACK	FUN111 STACK
-----------------	-------	-----------------

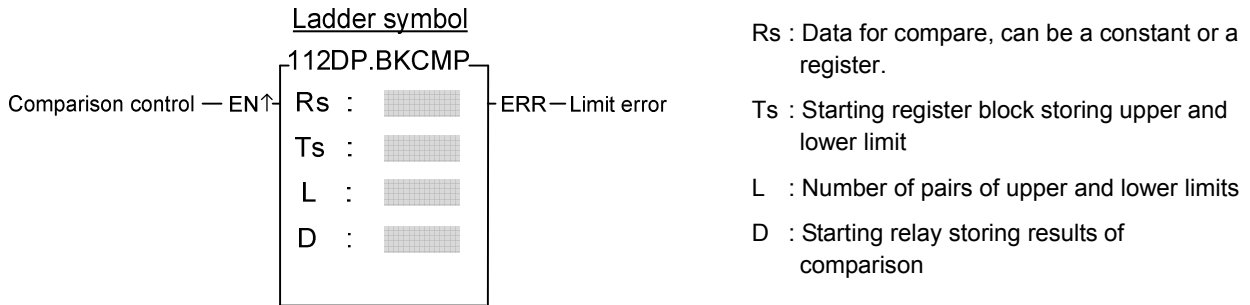

- When no data has yet been pushed into the stack or the pushed in data has already been popped out (Pr =0), the stack empty flag "EPT" will set to 1. In this case any further pop up actions, will be ignored. If more data is pushed than popped out, sooner or latter the stack will be full (pointer Pr points to ST<sub>L</sub> position), and the stack full flag "FUL" will set to 1. In this case any further push actions, will be ignored. As with queue, the stack pointer in normal case should not be changed by other instructions. If there is a special application which requires to set the Pr value, then its effective range is 0 to L (0 means empty, 1 to L respectively correspond to ST<sub>1</sub> to ST<sub>L</sub>). Beyond this range, the pointer error flag "ERR" will set to 1, and the instruction will not be carried out.

- The program at left assumes that the initial content of the stack is just as in the diagram of a stack on the preceding page. The operation illustrated in this example is to push a data and than pop it from stack. The results are shown below. Under any circumstances, Pr always point to the data that was most recently pushed into the stack.

FUN112 <b>D</b> <b>P</b> BKCMP	BLOCK COMPARE ( DRUM )	FUN112 <b>D</b> <b>P</b> BKCMP
-----------------------------------	------------------------	-----------------------------------

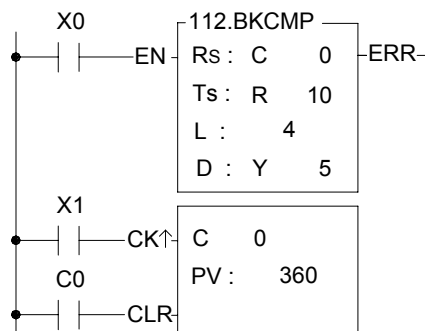

Range Operand	Y	M	S	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K
	Y0   Y255	M0   M999	S0   S999	WX0   WX240	WY0   WY240	WM0   WM1896	WS0   WS984	T0   T255	C0   C255	R0   R3839	R3840   R3903	R3904   R3967	R3968   R4167	R5000   R8071	D0   D4095	16/32-bit +/- number
Rs				○	○	○	○	○	○	○	○	○	○	○	○	○
Ts				○	○	○	○	○	○	○	○	○	○	○	○	
L														○*	○	1~256
D	○	○	○													

- When comparison control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, comparisons will be perform one by one between the contents of Rs and the upper and lower limits form by L pairs of 16 or 32-bit (**D** instruction) registers starting from the Ts register (starting from T0 each adjoining 2 register units form a pair of upper and lower limits). If the value of Rs falls within the range of the pair, then the bit within the comparison results relay D which corresponds to that pair will be set to 1. Otherwise it will be set as 0 until comparison of all the L pairs of upper and lower limits is completed.
- When M1975=0, if there is any pair where the upper limit value is less than the lower limit value, then the limit error flag "ERR" will be set to 1, and the comparison output for that pair will be 0.
- When M1975=1, there is no restriction on the relation of upper limit and lower limit, this can apply for 360°rotary electronic drum switch application.

- Actually this instruction is a drum switch, which can be used in interrupt program and when incorporate with immediate I/O instruction (IMDIO) can achieve an accurate electronic drum.

- In this program, C0 represents the rotation angle (Rs) of a drum shaft. The block compare instruction performs a comparison between Rs and the 4 pairs (L =4) of upper and lower limits, R10,R11, R12,R13, R14,R15 and R16,R17. The comparison results can be obtained from the four drum output points Y5 to Y8.
- The input point X1 is a rotation angle detector mounted on the drum shaft. With each one degree rotation of the drum shaft angle, X1 produces a pulse. When the drum shaft rotates a full cycle, X1 produces 360 pulses.

FUN112 **D P**  
BKCMP

BLOCK COMPARE (DRUM)

FUN112 **D P**  
BKCMP

- The program in the diagram above coordinates a rotary encoder or other rotating angle detection device (directly connect to a rotating mechanism), which can form a mechanical device equivalent to the mechanical structure of an actual drum (see mechanism shown within dotted line in diagram below). While the upper and lower limits are being adjusted, you can change at will the range of the activated angle of the drum. This cannot be done with the traditional drum mechanism.

Equivalent mechanical drum emulated by above program

FUN113 <b>DP</b> SORT	DATA SORTING	FUN113 <b>DP</b> SORT
--------------------------	--------------	--------------------------

Ladder symbol

S : Starting register of source registers to sort  
 D : Starting register of destination registers to store the data after sorted  
 L : Total register for sorting  
 S, D operand can combine with V, Z, P0~P9 for index addressing while word operation.

-------------------------	------------	-------------------------

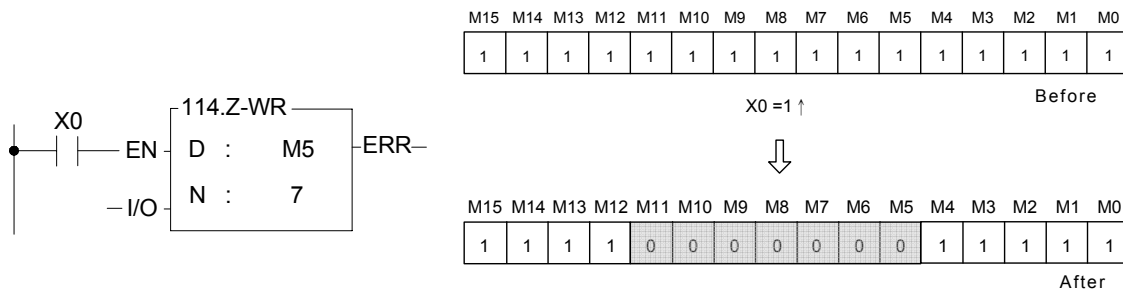

D : Starting address of being set or reset  
 N : Quantity of being set or reset, 1~511  
 D, N operand can combine V, Z, P0~P9 for index addressing while word operation.

Range Operand	Y	M	S	WY	WM	WS	TMR	CTR	HR	OR	SR	ROR	DR	K	XR
	Y0   Y255	M0   M1911	S0   S999	WY0   WY240	WM0   WM1896	WS0   WS984	T0   T255	C0   C199	R0   R3839	R3904   R3967	R3968   R4167	R5000   R8071	D0   D4095	1   511	V, Z   P0~P9
D	○	○	○	○	○	○	○	○	○	○	○*	○*	○		○
N									○			○	○	1-511	○

- When operation control "EN"=1 or "EN↑" (**P** instruction) changes from 0 to 1, it will perform the write operation according to the input status of write selection, the specified area of registers or bits will all be reset to 0 ("I/O"=0) or set to 1("I/O"=1).
- If the N value not in the effective range (N=0, N>511), the error flag "ERR" will be set to 1,

- Above example, registers R0~R9 will be reset to 0 while X0=1.

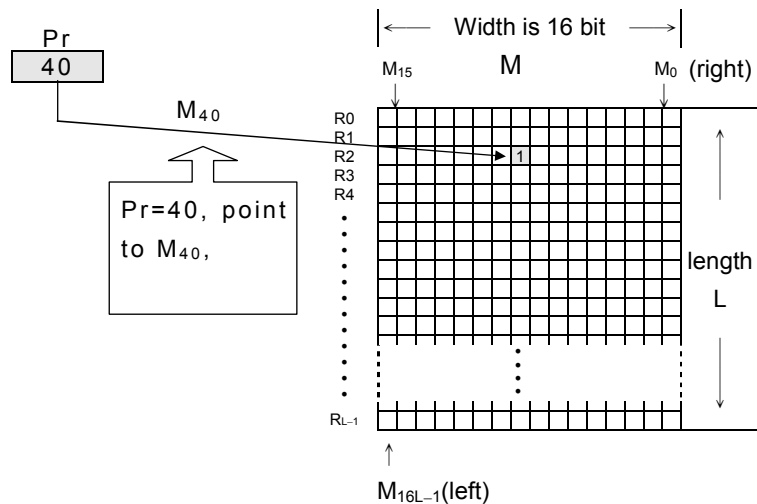

- Above example, bits M5~M11 will be reset to 0 while X0=1.

## Matrix Instructions

Fun No.	Functionality	Fun No.	Functionality
120	Matrix AND	126	Matrix Bit Read
121	Matrix OR	127	Matrix Bit Write
122	Matrix XOR	128	Matrix Bit Shift
123	Matrix XNOR	129	Matrix Bit Rotate
124	Matrix Inverse	130	Matrix Bit Count
125	Matrix Compare		

- A matrix is comprised of 2 or more consecutive 16-bit registers. The number of registers comprising the matrix is called the matrix length (L). One matrix altogether has  $L \times 16$  bits (points), and the basic unit of the object for each operation is bit.
- The matrix instructions treats the  $16 \times L$  matrix bits as a set of series points (denoted by  $M_0$  to  $M_{16L-1}$ ). Whether the matrix is formed by register or not, the operation object is the bit not numerical value.
- Matrix instructions are used mostly for discrete status processing such as moving, copying, comparing, searching, etc, of single point to multipoint (matrix), or multipoint-to-multipoint. These instructions are convenient, important for application.
- Among the matrix instructions, most instruction need to use a 16-bit register as a pointer to points a specific point within the matrix. This register is known as the matrix pointer (Pr). Its effective range is 0 to  $16L-1$ , which corresponds respectively to the bits  $M_0$  to  $M_{16L-1}$  within the matrix.
- Among the matrix operations, there are shift left/right, rotate left/right operations. We define the movement toward higher bit is left direction, while the movement toward lower bit is right direction, as shown in the diagram below.

FUN120 <b>P</b> MAND	MATRIX AND	FUN120 <b>P</b> MAND
-------------------------	------------	-------------------------

Ladder symbol

Ma : Starting register of source matrix a  
 Mb : Starting register of source matrix b  
 Md : Starting register of destination matrix  
 L : Length of matrix (Ma, Mb and Md)  
 Ma, Mb, Md may combine with V, Z, P0~P9 to serve indirect address application.

Range Operand	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
	WX0 WX240	WY0 WY240	WM0 WM1896	WS0 WS984	T0 T255	C0 C255	R0 R3839	R3840 R3903	R3904 R3967	R3968 R4167	R5000 R8071	D0 D4095	2 256	V, Z P0~P9
Ma	○	○	○	○	○	○	○	○	○	○	○	○		○

Ma	○	○	○	○	○	○	○	○	○	○	○	○		○
Mb	○	○	○	○	○	○	○	○	○	○	○	○		○
Md		○	○	○	○	○	○		○	○*	○*	○		○
L							○				○*	○	○	

- When operation control "EN" = 1 or "EN↑" (**P** instruction) changes from 0 to 1, this instruction will perform a logic OR (If any 2 of the bits are 1, then the result will be 1, and only if both are 0 will the result be 0) operation between 2 source matrixes with a length of L, Ma and Mb. The result will then be stored in the destination matrix Md, which is also the same length (the OR operation is done by bits with the same bit numbers). For example, if Ma<sub>0</sub> = 0, Mb<sub>0</sub> = 1, then Md<sub>0</sub> = 1; if Ma<sub>1</sub> = 0, Mb<sub>1</sub> = 0, then Md<sub>1</sub> = 0; etc, right up until OR reaches Ma<sub>16L-1</sub> and Mb<sub>16L-1</sub>.

- In the program at left, when X0 goes from 0 to 1, then matrix Ma, comprised by R0 to R4, and matrix Mb, comprised by R10 to R14, will do an OR operation. The results will then be stored into the destination matrix Md, comprised by R10 to R14. In this example, Mb and Md is the same matrix, so after operation the source matrix Mb will be replaced by the new value. The result is shown at right in the diagram below.

<table border="1" style="width:100%; border-collapse: collapse; text-align: center;"> <tr> <td></td> <td style="text-align: right;">Ma<sub>15</sub></td> <td></td> <td style="text-align: left;">Ma<sub>0</sub></td> </tr> <tr> <td></td> <td colspan="2" style="text-align: center;"><b>Ma</b></td> <td></td> </tr> <tr> <td>R0</td> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td> </tr> <tr> <td>R1</td> <td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td> </tr> <tr> <td>R2</td> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td> </tr> <tr> <td>R3</td> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td> </tr> <tr> <td>R4</td> <td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td> </tr> <tr> <td></td> <td style="text-align: left;">Ma<sub>79</sub></td> <td></td> <td style="text-align: right;">Ma<sub>64</sub></td> </tr> </table>		Ma <sub>15</sub>		Ma <sub>0</sub>		<b>Ma</b>			R0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	R1	1	1	1	1	1	1	0	0	0	0	0	0	0	0	R2	0	0	0	0	0	0	0	1	1	1	1	1	1	1	R3	0	0	0	0	0	0	0	0	0	0	0	0	0	0	R4	1	1	1	1	1	1	1	1	1	1	1	1	1	1		Ma <sub>79</sub>		Ma <sub>64</sub>	<table border="1" style="width:100%; border-collapse: collapse; text-align: center;"> <tr> <td></td> <td style="text-align: right;">Mb<sub>15</sub></td> <td></td> <td style="text-align: left;">Mb<sub>0</sub></td> </tr> <tr> <td></td> <td colspan="2" style="text-align: center;"><b>Mb</b></td> <td></td> </tr> <tr> <td>R10</td> <td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td> </tr> <tr> <td>R11</td> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td> </tr> <tr> <td>R12</td> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td> </tr> <tr> <td>R13</td> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td> </tr> <tr> <td>R14</td> <td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td> </tr> <tr> <td></td> <td style="text-align: left;">Mb<sub>79</sub></td> <td></td> <td style="text-align: right;">Mb<sub>64</sub></td> </tr> </table>		Mb <sub>15</sub>		Mb <sub>0</sub>		<b>Mb</b>			R10	1	1	1	1	1	1	1	1	1	1	1	1	1	1	R11	0	0	0	0	0	0	0	1	1	1	1	1	1	1	R12	0	0	0	0	0	0	0	1	1	1	1	1	1	1	R13	0	0	0	0	0	0	0	0	0	0	0	0	0	0	R14	1	1	1	1	1	1	1	1	1	1	1	1	1	1		Mb <sub>79</sub>		Mb <sub>64</sub>	<table border="1" style="width:100%; border-collapse: collapse; text-align: center;"> <tr> <td></td> <td style="text-align: right;">Md<sub>15</sub></td> <td></td> <td style="text-align: left;">Md<sub>0</sub></td> </tr> <tr> <td></td> <td colspan="2" style="text-align: center;"><b>Md</b></td> <td></td> </tr> <tr> <td>R20</td> <td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td> </tr> <tr> <td>R21</td> <td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td> </tr> <tr> <td>R22</td> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td> </tr> <tr> <td>R23</td> <td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td> </tr> <tr> <td>R24</td> <td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td> </tr> <tr> <td></td> <td style="text-align: left;">Md<sub>79</sub></td> <td></td> <td style="text-align: right;">Md<sub>64</sub></td> </tr> </table>		Md <sub>15</sub>		Md <sub>0</sub>		<b>Md</b>			R20	1	1	1	1	1	1	1	1	1	1	1	1	1	1	R21	1	1	1	1	1	1	1	1	1	1	1	1	1	1	R22	0	0	0	0	0	0	0	1	1	1	1	1	1	1	R23	0	0	0	0	0	0	0	0	0	0	0	0	0	0	R24	1	1	1	1	1	1	1	1	1	1	1	1	1	1		Md <sub>79</sub>		Md <sub>64</sub>

FUN124 <b>P</b> MINV	MATRIX INVERSE	FUN124 <b>P</b> MINV
-------------------------	----------------	-------------------------

Ladder symbol

Ms : Starting register of source matrix

Md : Starting register of destination

L : Length of matrix (Ms and Md)

Ma, Md may combine with V, Z, P0~P9 to serve indirect address application.

Range Ope- rand	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
	WX0 WX240	WY0 WY240	WM0 WM1896	WS0 WS984	T0 T255	C0 C255	R0 R3839	R3840 R3903	R3904 R3967	R3968 R4167	R5000 R8071	D0 D4095	2 256	V, Z P0~P9
Ms	○	○	○	○	○	○	○	○	○	○	○	○		○
Md		○	○	○	○	○	○			○*	○*	○		○
L							○				○*	○	○	

- When operation control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, source register Ms, which has a length of L, will be completely inverted (all the bits with a value of 1 will change to 0, and all those with a value of 0 will change to 1). The results will then be stored into destination matrix Md.

- In the program at left, when X0 goes from 0 to 1, the matrix comprised by R0 to R4 will be inverted, and then store back into itself (because in this example Ms and Md are the same matrix). The results obtained are shown at right in the diagram below.

Pr		○	○	○	○	○	○		○	○*	○*	○		

- When comparison control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, then beginning from the top pair of bits (Ma<sub>0</sub> and Mb<sub>0</sub>) within the 2 matrixes Ma and Mb (when "FHD" =1 or Pr value is equal to 16L-1), or beginning from the next pair of bits (Mapr + 1 and Mbpr + 1) pointed by pointer Pr (when "FHD" =0 and Pr value is less than L-1), this instruction will compare and search for pairs of bits with different value (when D/S =1) or the same value (when D/S =0). Once match found, pointer Pr will point to the bit number in the matrix met the search condition. The found objective flag "FND" will be set to 1. When it has searched to the final pair of bits in the matrix (Ma<sub>16L-1</sub>, Mb<sub>16L-1</sub>), this execution of the instruction will finish, no matter it has found or not. If this happen then The compare-to-end flag "END" will be set as 1, and the Pr value will set to 16L-1 and the next time that this instruction is executed, Pr will automatically return to the starting point of the matrix (Pr =0) to begin the comparison search.
- The range for the pointer value is 0 to 16L-1. The Pr value should not be changed by other instructions, as this will affect the result of search. If the Pr value exceeds its range, then the pointer error flag "ERR" will be set to 1, and this instruction will not be carried out.

- In the program at left, the "FHD" input is 0, so starting from a position 1 greater than the pointer value at that time (marked by \*), the instruction will do a search for bits with different status (because D/S =1). When X0 has a transition from 0 to 1 three times, the results are shown at right in the diagram below.

FUN126 <b>P</b> MBRD	MATRIX BIT READ	FUN126 <b>P</b> MBRD
-------------------------	-----------------	-------------------------

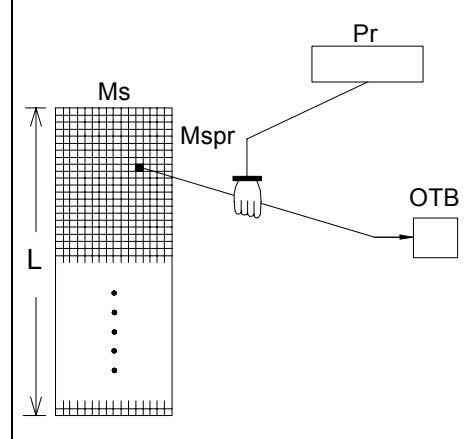

Ladder symbol

Ms : Starting register of matrix  
 L : Matrix length  
 Pr : Pointer register  
 Ms may combine with V, Z, P0~P9 to serve indirect address application.

Range / Operand	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
	WX0 WX240	WY0 WY240	WM0 WM1896	WS0 WS984	T0 T255	C0 C255	R0 R3839	R3840 R3903	R3904 R3967	R3968 R4167	R5000 R8071	D0 D4095	2 256	V, Z P0~P9
Ms	○	○	○	○	○	○	○	○	○	○	○	○		○
L							○				○*	○	○	
Pr		○	○	○	○	○	○		○	○*	○*	○		

- When readout control "EN" =1 or "EN↑" (P instruction) changes from 0 to 1, the status of the bit Mspr pointed by pointer Pr within matrix Ms will be read out and appear at the output bit "OTB". Before the readout, this instruction will first check the input -pointer clear "CLR". If "CLR" is 1, then the Pr value will be cleared to 0 first before the readout action is carried out. After the readout is completed, If the Pr value has already reached 16L-1 (the final bit), then the read-to-end flag "END" will be set to 1. If Pr is less than 16L-1, then the status of pointer increment "INC" will be checked. If "INC" is 1, then Pr will be increased by 1. Besides this, pointer clear "CLR" can execute independently, and is not affected by other input.

- The effective range of the pointer is 0 to 16L-1. Beyond this range the pointer error flag "ERR" will be set to 1, and this instruction will not be carried out.

- In the program at left, INC =1, so every time there is one readout the pointer will be increased by 1. With this way each bit in Ms may be read out successively, as shown at left in the diagram below. When X0 goes 3 times from 0 to 1, the results are shown at right in the diagram below .

FUN127 <b>P</b> MBWR	MATRIX BIT WRITE	FUN127 <b>P</b> MBWR
-------------------------	------------------	-------------------------

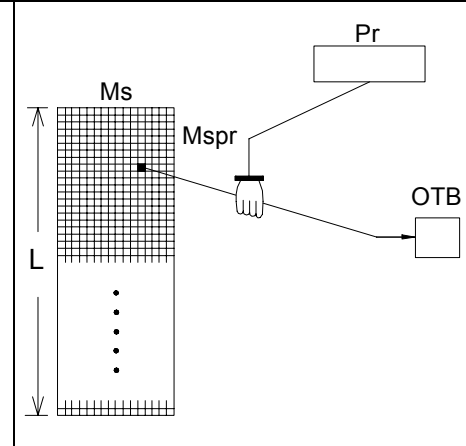

Ladder symbol

Md : Starting register of matrix  
 L : Matrix length  
 Pr : Pointer register  
 Md may combine with V, Z, P0~P9 to serve indirect address application.

Range	WY	WM	WS	TMR	CTR	HR	OR	SR	ROR	DR	K	XR
	WY0	WM0	WS0	T0	C0	R0	R3904	R3968	R5000	D0	2	V, Z
Operand	WY240	WM1896	WS984	T255	C255	R3839	R3967	R4167	R8071	D4095	256	P0~P9
Md	○	○	○	○	○	○	○	○	○	○	○	○
L									○*	○	○	
Pr	○	○	○	○	○	○	○	○*	○*	○		

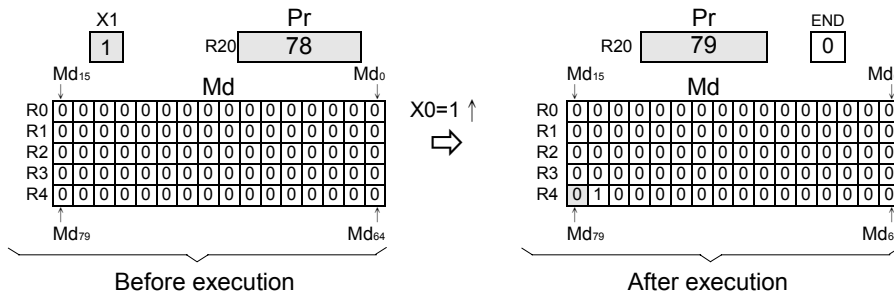

- When write control "EN" = 1 or "EN↑" (**P** instruction) changes from 0 to 1, the status of the write-in bit "INB" will be written into the bit Mdpr pointed by pointer Pr within matrix Md. Before the write-in takes place, the status of pointer clear "CLR" will be checked. If "CLR" is 1, then Pr will be cleared to 0 before the write-in action. After the write-in action has been completed, the Pr value will be checked again. If the Pr value has already reached 16L-1 (last bit), then the write-to-end flag will be set to 1. If the Pr value is less than 16L-1 and "INC" is 1, then the pointer will be increased by 1. Besides this, pointer clear "CLR" can execute independently, and is not affected by other input.

- The effective range of Pr is 0 to 16L-1. Beyond this range, the pointer error flag "ERR" will be set to 1 and this instruction will not be carried out.

- In the program at left, pointer will be increased each time execution (because "INC" is 1). As shown in the diagram below, when X0 has a transition from 0 to 1, the status of INB (X1) will be written into the Mdpr (Md<sub>78</sub>) position, and pointer Pr will be increased by 1 (changing to 79). In this case, although Pr is pointing to the end, it has not yet been written into Md<sub>79</sub>, so "END" flag is still 0. Only the next attempt to write to Md<sub>79</sub> will set "END" to 1.

FUN129 <b>P</b> MBROT	MATRIX BIT ROTATE	FUN129 <b>P</b> MBROT
--------------------------	-------------------	--------------------------

Ladder symbol

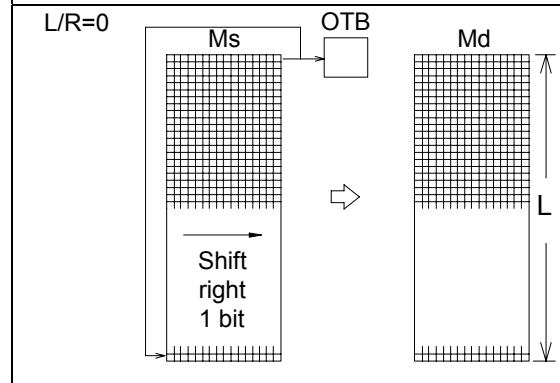

Ms : Starting register of source matrix  
 Md : Starting register of destination matrix  
 L : Length of matrix (Ms and Md)  
 Ms, Md may combine with V, Z, P0~P9 to serve indirect address application.

Range	WX	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
	WX0	WY0	WM0	WS0	T0	C0	R0	R3840	R3904	R3968	R5000	D0	2	V, Z

Md		○	○	○	○	○	○	○	○	○*	○*	○		○
L							○				○*	○	○	

- When rotate control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, matrix Ms will be completely retrieved and rotated by one bit towards the left (when L/R =1) or to the right (when L/R =0). The space created by the rotation (with a left rotation it will be M0, and with a right rotation it will be M<sub>16L-1</sub>) will be replaced by the status of the rotated-out bit (with a left rotation it will be M<sub>16L-1</sub>, and with a right rotation it will be M0). The rotated-out bit will not only be used to fill the above-mentioned space, it will also be transferred to rotated-out bit "OTB".

- In the program at below, Ms and Md are the same matrix. When X0 goes from 0 to 1, then the whole of Ms is retrieved and rotated right (because L/R =0) by 1 bit. It is then stored back into Ms itself (because in this example Ms and Md are the same matrix). The results are shown at right in the diagram below.

FUN130 <b>P</b> MBCNT	MATRIX BIT STATUS COUNT	FUN130 <b>P</b> MBCNT
--------------------------	-------------------------	--------------------------

Ladder symbol

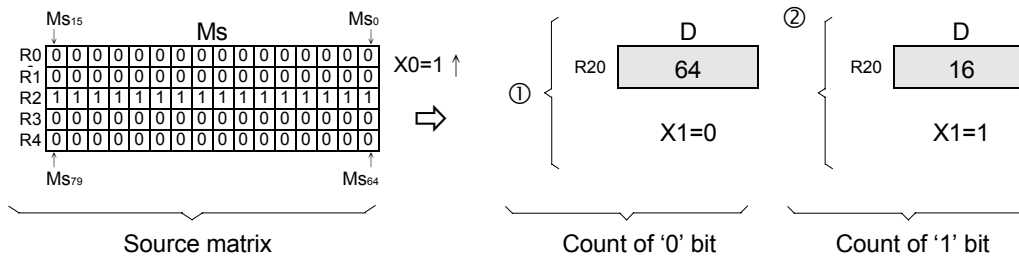

Ms : Starting register of matrix  
 L : Matrix length

WR			○	○	○	○	○	○		○	○	○	○	

**Description**

- The setting of resolution (Rs) must be same between output0 (Y0) and output1 (Y2) also the setting of output frequency (Pn). It means both output0 and output1 have the same output frequency and the same output resolution, only the pulse width can be different. Same principle for output2 (Y4) and output3 (Y6).
- When operation control “EN” =1, the specified digital output will perform the PWM output, the expression for output frequency as shown below:

$$1. f_{pwm} = \frac{184320}{(P_n + 1)} \quad \text{while Rs(Resolution)=1/100}$$

$$2. f_{pwm} = \frac{18432}{(P_n + 1)} \quad \text{while Rs(Resolution)=1/1000}$$

Example 1 : If Pn ( Setting of output frequency ) = 50, Rs = 0( 1/100 ), then

$$f_{pwm} = \frac{184320}{(50 + 1)} = 3614.117 \dots \approx 3.6\text{KHz}$$

$$T(\text{Period}) = \frac{1}{f_{pwm}} \approx 277\mu\text{s}$$

For Rs =1/100, if OR( Setting of output pulse width ) =1, then T0 ≈ 2.7μs ; if OR( Setting of output pulse width ) = 50, then T0 ≈ 140μs .

.Output waveform :

(1). Pn ( Output frequency ) =50, Rs =0 ( 1/100 ), OR ( Output pulse width ) =1 :

FUN 139 HSPWM	HIGH SPEED PULSE WIDTH MODULATION OUTPUT	FUN 139 HSPWM
------------------	--	------------------

(2) .Pn ( Output frequency ) =50, Rs = 0 ( 1/100 ), OR ( Output pulse width ) =50 :

Example 2 : If Pn ( Setting of output frequency ) =200, Rs = 1( 1/1000 ), then

$$f_{pwm} = \frac{18432}{(200 + 1)} \cong 91.7\text{Hz}$$

$$T(\text{Period}) = \frac{1}{f_{pwm}} \cong 10.9\text{ms}$$

For Rs =1/1000, if OR( Setting of output pulse width ) =10, then  $T_o \cong 109\mu s$ ; if OR( Setting of output pulse width ) =800, then  $T_o \cong 8.72\text{ms}$

.Output waveform :

(1). Pn ( Output frequency ) =200, Rs =1 ( 1/1000 ), OR ( Output pulse width ) =10 :

$T_o \cong 109\mu s$

(2) .Pn ( Output frequency ) =200, Rs =1 ( 1/1000 ), OR ( Output pulse width ) =800 :

D	○	○	○	

**Command descriptions**

- When execution control “EN” =1 or “EN↑” (**P** instruction) changes from 0 to 1, this instruction will convert the assigned current pulse position (PS) to be the mm (or Deg, Inch, or PS) that has same unit as the set value, so as to make current position displaying.
- Only when the FUN140 instruction is executed, then it can get the correct conversion value by executing this instruction.
- For detailed functional description and usage, please refer to chapter 13 “The NC positioning control of WSZ-controller” for explanation.

Advanced Function Instruction

FUN 147 MHSP0	MULTI-AXIS HIGH SPEED PULSE OUTPUT (Brief description on function)	FUN 147 MHSP0
------------------	---	------------------

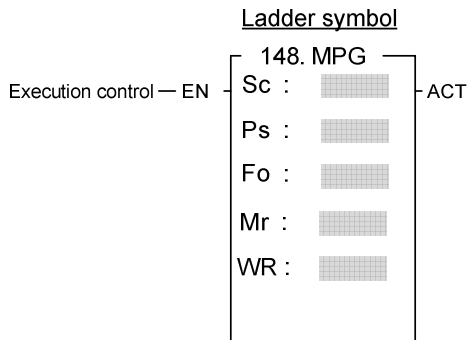

Range	HR	DR	ROR	K
Operand	R0   R3839	D0   D4095	R5000   R8071	
Gp				0~1
SR	○	○	○	
WR	○	○	○*	

**Instruction Explanation**

1. The FUN147 (MHSP0) instruction is used to support the linear interpolation for multi-axis motion control, it consists of the motion program written and edited with text programming. We named every position point as a step (which includes output frequency, traveling distance, and transfer conditions). Every step of positioning point owns 15 registers for coding.
2. The FUN147 (MHSP0) instruction can support up to 4 axes for simultaneous linear interpolation; or 2 sets of 2-axis linear interpolation (i.e. Gp0 = Axes Ps0 & Ps1; Gp1 = Axes Ps2 & Ps3)
3. The best benefit to store the positioning program into the registers is that in the case of association with MMI (Man Machine Interface) to operate settings, it may save and reload the positioning program via MMI when replacing the molds.
4. When execution control "EN" =1, if the other FUN147/FUN140 instructions to control Ps0~3 are not active (corresponding status of Ps0=M1992, Ps1=M1993, Ps2=M1994, and Ps3=M1995 will be ON), it will start to execute from the next step of positioning point (when goes to the last step, it will be restarted from the first step to perform); if Ps0~3 is controlled by other FUN147/FUN140 instruction (corresponding status of Ps0=M1992, Ps1=M1993, Ps2=M1994, and Ps3=M1995 would be OFF), this instruction will acquire the pulse output right of positioning control once the controlling FUN147/FUN140 has released the control right.
5. When execution control "EN" =0, it stops the pulse output immediately.
6. When output pause "PAU" =1 and execution control "EN" was 1 beforehand, it will pause the pulse output. When output pause "PAU" =0 and execution control is still 1, it will continue the unfinished pulse output.
7. When output abort "ABT"=1, it stops pulse output immediately. (When the execution control input "EN" becomes 1 next time, it will restart from the first step of positioning point to execute.)
8. While the pulse is in output transmitting, the output indication "ACT" is ON.
9. When there is execution error, the output indication "ERR" will be ON.  
(The error code is stored in the error code register.)
10. When each step of positioning point is complete, the output indication "DN" will be ON.

FUN 147 MHSPO	MULTI-AXIS HIGH SPEED PULSE OUTPUT (Brief description on function)	FUN 147 MHSPO

- Let this instruction be executed in 50ms fixed time interrupt service routine (50MSI) or by using the 0.1ms high speed timer to generate 50ms fixed time interrupt service to have accurate repeat time to sample the pulse input from manual pulse generator. If it comes the input pulses, it will calculate the number of pulses needing to output according to the setting of multiplier (Mr+0 and Mr+1), and then outputs the pulse stream in the speed of setting (Fo) during this time interval.

The setting of output speed (Fo) must be fast enough, and the acceleration / deceleration rate ( Parameter 4 and parameter 8 of FUN141 instruction) must be sharp to guarantee it can complete the sending of pulse stream during the time interval if it is under high multiplier (100 or 200 times) situation.

- When execution control “EN” =1, this instruction will sample the pulse input from manual pulse generator by reading the current value of assigned high speed counter every time interval; it doesn't have any output if it doesn't have any input pulse; but If it senses the input pulses, it will calculate the number of pulses needing to output according to the setting of multiplier (Mr+0 and Mr+1), and then outputs the pulse stream in the speed of setting (Fo) during this time interval.

$$\text{Number of output pulses} = (\text{Number of input pulses} \times Fa) / Fb$$

- This instruction also under the control of hardware resource management; it wouldn't be executed if the hardware is occupied.
- The output indicator “ACT” =1 if it outputs the pulses; otherwise “ACT” =0.
- For detailed functional description and usage, please refer to chapter 13 “The NC positioning control of WSZ-controller” for explanation.

FUN145 <b>P</b> EN	ENABLE CONTROL OF THE INTERRUPT AND PERIPHERAL	FUN145 <b>P</b> EN
-----------------------	--	-----------------------

Ladder symbol

LBL : External input or peripheral label name that to be enabled.

- When enable control “EN” =1 or “EN↑” (**P** instruction) changes from 0 to 1, it allows the external input or peripheral interrupt action which is assigned by LBL.
- The enabled interrupt label name is as follows.

LBL name	Description	LBL name	Description	LBL name	Description
HSTAI	HSTA High speed counter interrupt	X4+I	X4 positive edge interrupt	X10+I	X10 positive edge interrupt
HSC0I	HSC0 High speed counter interrupt	X4-I	X4 negative edge interrupt	X10-I	X10 negative edge interrupt
HSC1I	HSC1 High speed counter interrupt	X5+I	X5 positive edge interrupt	X11+I	X11 positive edge interrupt
HSC2I	HSC2 High speed counter interrupt	X5-I	X5 negative edge interrupt	X11-I	X11 negative edge interrupt
HSC3I	HSC3 High speed counter interrupt	X6+I	X6 positive edge interrupt	X12+I	X12 positive edge interrupt
X0+I	X0 positive edge interrupt	X6-I	X6 negative edge interrupt	X12-I	X12 negative edge interrupt
X0-I	X0 negative edge interrupt	X7+I	X7 positive edge interrupt	X13+I	X13 positive edge interrupt
X1+I	X1 positive edge interrupt	X7-I	X7 negative edge interrupt	X13-I	X13 negative edge interrupt
X1-I	X1 negative edge interrupt	X8+I	X8 positive edge interrupt	X14+I	X14 positive edge interrupt
X2+I	X2 positive edge interrupt	X8-I	X8 negative edge interrupt	X14-I	X14 negative edge interrupt
X2-I	X2 negative edge interrupt	X9+I	X9 positive edge interrupt	X15+I	X15 positive edge interrupt
X3+I	X3 positive edge interrupt	X9-I	X9 negative edge interrupt	X15-I	X15 negative edge interrupt
X3-I	X3 negative edge interrupt				

- In practical application, some interrupt signals should not be allowed to work at sometimes, however, it should be allowed to work at some other times. Employing FUN146 (DIS) and FUN145 (EN) instructions could attain the above mentioned demand.

**Program example**

- When M0 changes from 0 to 1, it allows X0 to send interrupt when X0 changes from 0 to 1. CPU can rapidly process the interrupt service program of X0+I.

FUN146 <b>P</b> DIS	DISABLE CONTROL OF THE INTERRUPT AND PERIPHERAL	FUN146 <b>P</b> DIS
------------------------	---	------------------------

Ladder symbol

LBL : Interrupt label intended to disable or peripheral name to be disabled.

- When disable control “EN” =1 or “EN↑” (**P** instruction) changes from 0 to 1, it disable the interrupt or peripheral operation designated by LBL.
- The interrupt label name is as follows:

LBL name	Description	LBL name	Description	LBL name	Description
HSTAI	HSTA High speed counter interrupt	X4+I	X4 positive edge interrupt	X10+I	X10 positive edge interrupt
HSC0I	HSC0 High speed counter interrupt	X4-I	X4 negative edge interrupt	X10-I	X10 negative edge interrupt
HSC1I	HSC1 High speed counter interrupt	X5+I	X5 positive edge interrupt	X11+I	X11 positive edge interrupt
HSC2I	HSC2 High speed counter interrupt	X5-I	X5 negative edge interrupt	X11-I	X11 negative edge interrupt
HSC3I	HSC3 High speed counter interrupt	X6+I	X6 positive edge interrupt	X12+I	X12 positive edge interrupt
X0+I	X0 positive edge interrupt	X6-I	X6 negative edge interrupt	X12-I	X12 negative edge interrupt
X0-I	X0 negative edge interrupt	X7+I	X7 positive edge interrupt	X13+I	X13 positive edge interrupt
X1+I	X1 positive edge interrupt	X7-I	X7 negative edge interrupt	X13-I	X13 negative edge interrupt
X1-I	X1 negative edge interrupt	X8+I	X8 positive edge interrupt	X14+I	X14 positive edge interrupt
X2+I	X2 positive edge interrupt	X8-I	X8 negative edge interrupt	X14-I	X14 negative edge interrupt
X2-I	X2 negative edge interrupt	X9+I	X9 positive edge interrupt	X15+I	X15 positive edge interrupt
X3+I	X3 positive edge interrupt	X9-I	X9 negative edge interrupt	X15-I	X15 negative edge interrupt
X3-I	X3 negative edge interrupt				

- In practical application, some interrupt signals should not be allowed to work at certain situation. To achieve this, this instruction may be used to disable the interrupt signal.

**Program example**

- When M0 changes from 0 to 1, it prohibits X2 from sending interrupt when X2 changes from 0 to 1.

FUN150 M-BUS	<b>MODBUS MASTER INSTRUCTION</b> ( WHICH MAKES CONTROLLER AS THE MODBUS MASTER THROUGH PORT 1~2 )	FUN150 M-BUS
-----------------	---	-----------------

Ladder symbol

Pt : 1~2, specify the communication port being acted as the Modbus master

SR : Starting register of communication program

WR : Starting register for instruction operation. It controls 8 registers, the other programs can not repeat in using.

	Range	HR	ROR	DR	K

Pt					1~2
SR	○	○	○		
WR	○	○*	○		

**Description**

1. FUN150 (M-BUS) instruction makes controller act as Modbus master through Port 1~2, thus it is very easy to communicate with the intelligent peripheral with Modbus protocol.
2. The master controller may connect with 247 slave stations through the RS-485 interface.
3. Only the master controller needs to use M-BUS instruction.
4. It employs the program coding method or table filling method to plan for the data flow controls; i.e. from which one of the slave station to get which type of data and save them to the master controller, or from the master controller to write which type of data to the assigned slave station. It needs only seven registries to make definition; every seven registers define one packet of data transaction.
5. When execution control “EN” changes from 0 to 1 and input Abort “ABT” is 0, and if Port 1/2 hasn’t been controlled by other communication instructions [i.e. M1960 (Port1) / M1962 (Port2) / = 1], this instruction will control the Port 1/2 immediately and set the M1960/M1962 to be 0 (which means it is being occupied), then going on a packet of data transaction immediately. If Port 1/2 has been controlled (M1960/M1962 = 0), then this instruction will enter into the standby status until the controlling communication instruction completes its transaction or abort its operation to release the control right (M1960/M1962 =1), and then this instruction will become enactive, set M1960/M1962 to be 0, and going on the data transaction immediately.
6. While in transaction processing, if operation control “ABT” becomes 1, this instruction will abort this transaction immediately and release the control right (M1960/M1962 = 1). Next time, when this instruction takes over the transmission right again, it will restart from the first packet of data transaction.
7. While “A/R” =0 , Modbus RTU protocol ; “A/R” =1 , Modbus ASCII protocol .
8. While it is in the data transaction, the output indication “ACT” will be ON.
9. If there is error occurred when it finishes a packet of data transaction, the output indication “DN” & “ERR” will be ON.
10. If there is no error occurred when it finishes a packet of data transaction, the output indication “DN” will be ON.
11. For detailed functional description and usage, please refer to chapter 12 “The Applications for WSZ Communication Link” for explanation.

Advanced Function Instruction

FUN161 WR-MP	Write Data Record into the MEMORY_PACK (Write memory pack)	FUN161 WR-MP
-----------------	---	-----------------

- If the value of L is equal to 0 or greater than 128, or the pointed data area over the range, the output "ERR" will be 1, it will not perform the writing operation.
- It needs couple of Controller solving scans for data writing and verification; during the execution, the output "ACT" will be 1; when completing the execution and verification without the error, the output "DN" will be 1; when completing the execution and verification with the error, the output "ERR" will be 1.
- The MEMORY\_PACK can be configured to store the user's ladder program or machine's working parameters, or both. The ladder program can be stored into the block 0 only, but the machine's working parameters can be stored into block 0 or 1; the memory capacity of each block has 32K Word in total.

Example program: Writing the record into block 1 of MEMORY\_PACK with the different length

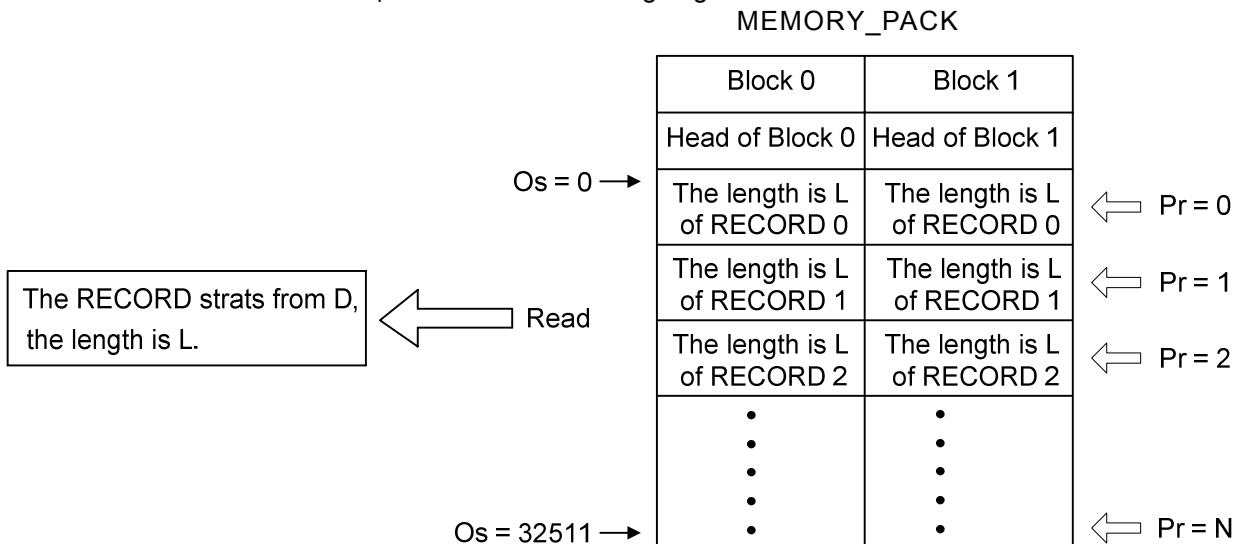

FUN162 <b>P</b> RD-MP	Read Data Record from the MEMORY_PACK ( Read memory pack )	FUN162 <b>P</b> RD-MP
--------------------------	---	--------------------------

Range	WY	WM	WS	TMR	CTR	HR	IR	OR	SR	ROR	DR	K	XR
Ope- rand	WY0	WM0	WS0	T0	C0	R0	R3840	R3904	R3968	R5000	D0		V, Z
	WY240	WM1896	WS984	T255	C255	R3839	R3903	R3967	R4167	R8071	D4095		P0~P9
BK												0~1	
Os						○				○	○	0~32511	
Pr	○	○	○	○	○	○		○	○	○*	○		
L						○	○	○	○	○*	○	1~128	
D						○				○*	○		○

- If the MEMORY\_PACK of the WSZ series' has stored the data record written by the FUN161 instruction, they can be read out for machine's working through this instruction; it will reduce the tuning time for machine operation.
- When operation control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, it will perform the data reading, where BK is the block number of the MEMORY\_PACK storing the record, Os is the offset of specified block, Pr is the pointer to point to corresponding data area, L is the quantity of this record, and D is the starting address to store this reading of record. The access of MEMORY\_PACK manipulation adopts the concept of RECORD data structure to implement with. The working diagram as shown below:

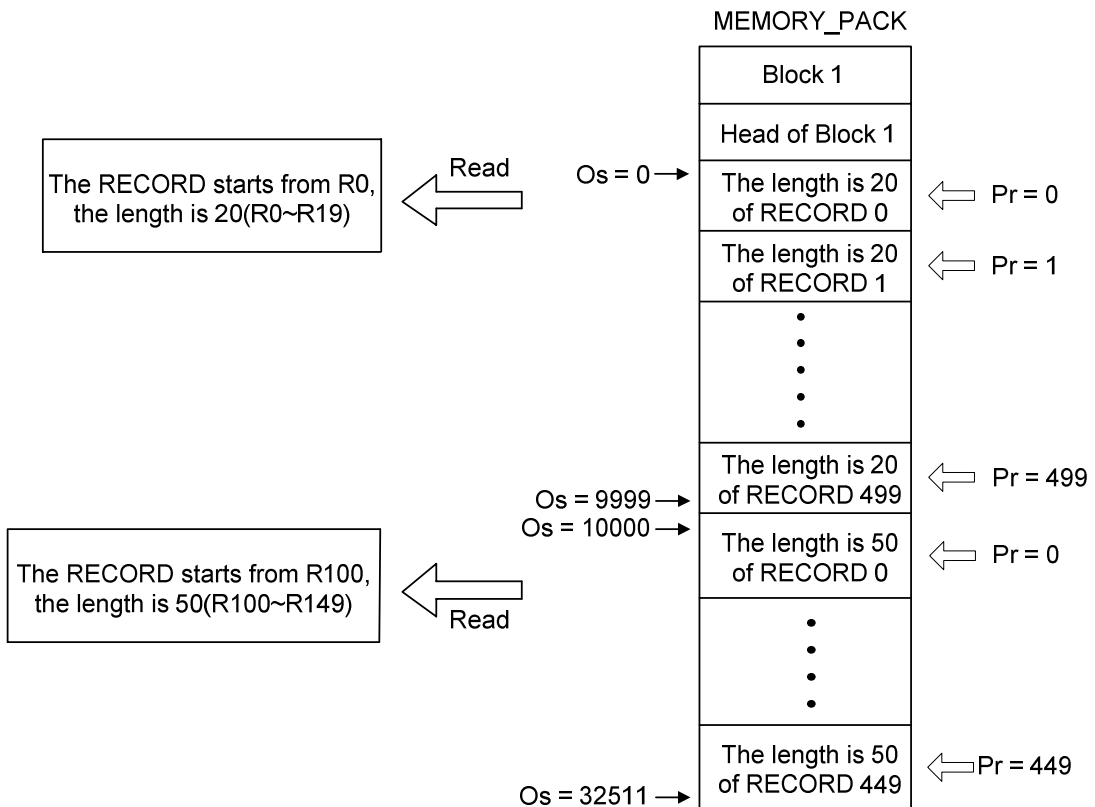

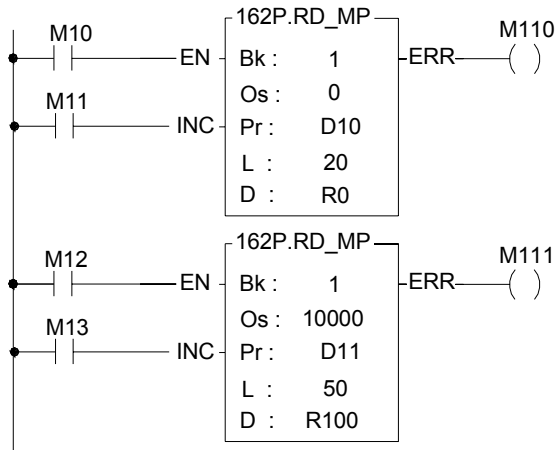

- When input "INC"=1, the content of the pointer will be increased by one after the execution of reading, it points to next record.

<b>FUN162 P</b> RD-MP	Read Data Record from the MEMORY_PACK ( Read memory pack )	<b>FUN162 P</b> RD-MP
--------------------------	---	--------------------------

- If the value of L is equal to 0 or greater than 128, or the pointed data area over the range, the output "ERR" will be 1, it will not perform the reading operation.
- Output will be "ERR" if MEMORY\_PACK is empty or data format not correct and user used FUN162 to read data from MEMORY\_PACK.

**Example program: Reading the record from block 1 of MEMORY\_PACK with the different length**

※ It is necessary that correct data in MEMORY\_PACK or this example can't execute correctly.

<b>FUN170 D</b> =	<b>EQUAL TO COMPARE</b> ( Compare whether Sa is equal to Sb )	<b>FUN170 D</b> =
----------------------	--	----------------------

Sa: Operand A or the starting address of Sa  
 Sb: Operand B or the starting address of Sb  
 Sa, Sb may combine with V,Z,P0~P9 for indirect addressing application

Sa	○	○	○	○	○	○	○	○	○	○	○	○	○	○
Sb	○	○	○	○	○	○	○	○	○	○	○	○	○	○

- When execution control "EN"=1, this instruction will be executed in signed number to compare Sa with Sb. If  $Sa \leq Sb$ , the output is 1; otherwise the output is 0.

**Example 1:**

Description: When M10=1,  $R20 \leq R22$  or M11=1, the output status of Y2 is 1; otherwise it is 0.

**Example 2:**

Description: When  $DR600=DR602$  or  $DR604>DR606$ , after them  $DR608<DR610$  and  $DR616 \geq DR618$ , or  $DR612 \neq DR614$  and  $DR620 \leq DR622$ , or M200=1 and M201=1, and then M100=1, the output status of Y10 is 1; otherwise it is 0.

Sb															○
Pr		○	○	○	○	○	○		○	○*	○*	○			
L							○				○*	○	1~511		

**Description**

- When operation control "EN"=1 or "EN↑" (**P** instruction) changes from 0 to 1, it will perform the read ("R/W"=1) or write ("R/W"=0) file register operation. While reading, the content of data registers starting from Sa will be overwritten by the content of file registers addressed by the base file register Sb and record pointer Pr; while writing, the content of file registers addressed by the base file register Sb and record pointer Pr will be overwritten by the content of data registers starting from Sa; L is the operation quantity or record size. The access of file register adopts the concept of RECORD data structure to implement. For example, Sa=R0, Sb=F0, L=10, the read/write details shown as below.

Advanced Function Instruction

FUN160 <b>D P</b> RWFR	READ/WRITE FILE REGISTER	FUN160 <b>D P</b> RWFR
---------------------------	--------------------------	---------------------------

- For ladder program application, only this instruction can access the file registers.
- The record pointer will be increased by 1 after execution while pointer control input "INC"=1.
- This instruction will not be executed and error indicator "ERR" will be 1 while incorrect record size (L=0 or > 511) or the operation out of the file register's range (F0~F8191).

When M0 changes from 0 to 1, if D0 =2, the contents of file registers F200~F249 will be overwritten by the content of data registers R0~R49. the record length is 50.  
Pointer will be increased by 1 after operation.

When M0 changes from 0 to 1, if D0 =1, the content of data registers R0~R49 will be overwritten by the file registers F150~F199.  
The record pointer will be increased by 1 after operation.

FUN200 <b>D</b> <b>P</b> I→F	CONVERSION OF INTEGER TO FLOATING POINT NUMBER	FUN200 <b>D</b> <b>P</b> I→F

FUN 206 <b>P</b> FCMP	FLOATING POINT NUMBER COMPARE	FUN 206 <b>P</b> FCMP
--------------------------	-------------------------------	--------------------------

Ladder symbol

Sa: The register to be compared  
 Sb: The register to be compared  
 Sa, Sb may combine with V, Z, P0~P9 to serve indirect addressing.

Range	HR	ROR	DR	K	XR
	R0	R5000	D0	Floating point number	V, Z
	↓	↓	↓		
Operand	R3839	R8071	D4095		P0~P9
Sa	○	○	○	○	○
Sb	○	○	○	○	○

**Description**

- The format of floating point number of WSZ-controller follows the IEEE-754 standard.
- Compares the data of Sa and Sb when the compare control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1. If the data of Sa is equal to Sb, then set FO0 to 1. If the data of Sa>Sb, then set FO1 to 1. If the data of Sa<Sb, then set the FO2 to 1. If the data of Sa < Sb, then set the FO2 to 1.

- From the above example, we first assume the data of DR0 is 200.1 and DR2 is 200.2, and then compare the data by executing the CMP instruction. The FO0 and FO1 are set to 0 and FO2 (a<b) is set to 1 since a<b.
- If you want to have the compound results, such as ≥, ≤, < > etc., please send =, < and > results to relay first and then combine the result from the relays.

FUN 207 <b>P</b> FZCP	FLOATING POINT NUMBER ZONE COMPARE	FUN 207 <b>P</b> FZCP
--------------------------	------------------------------------	--------------------------

Ladder Symbol

Compare control — EN↑

207P.FZCP

S :  INZ — Inside zone

Su :  S>U — Higher than upper limit

SL :  S<L — Lower than lower limit

ERR — Limit value error

S : Register for zone comparison

SU: The upper limit value

SL: The lower limit value

S, SU, SL may combine with V, Z, P0~P9 to serve indirect address application.

Range	HR	ROR	DR	K	XR
	R0	R5000	D0	Floating point number	V, Z
Operand	R3839	R8071	D4095		P0~P9
S	○	○	○		○
Su	○	○	○	○	○
SL	○	○	○	○	○

**Description**

- The format of floating point number of WSZ-controller follows the IEEE-754 standard.
- When compare control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, compares S with upper limit SU and lower limit SL. If S is between the upper limit and the lower limit ( $S_L \leq S \leq S_U$ ), then set the inside zone flag "INZ" to 1. If the value of S is greater than the upper limit  $S_U$ , then set the higher than upper limit flag "S>U" to 1. If the value of S is smaller than the lower limit  $S_L$ , then set the lower than lower limit flag "S<L" as 1.
- The upper limit  $S_U$  should be greater than the lower limit  $S_L$ . If  $S_U < S_L$ , then the limit value error flag "ERR" will set to 1, and this instruction will not carry out.

- The instruction at left compares the value of DR10 with the upper and lower limit zones formed by DR12 and DR14. If the values of DR10~DR14 are as shown in the diagram at bottom left, then the result can then be obtained as at the right of this diagram.
- If want to get the status of out side the zone, then OUT NOT Y0 may be used, or an OR operation between the two outputs S>U and S<L may be carried out, and move the result to Y0.

**Description**

- The format of floating point number of WSZ-controller follows the IEEE-754 standard.
- When operation control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, take the TAN value of the angle data specified by the S register and store the result into the register D~D+1 in floating point number format. The valid range of the angle is from -18000 to +18000, unit in 0.01 degree.
- If the S value is not within the valid range, then the S value error flag "ERR" will be set to 1, and do not execute the operation.

- At left, the example program gets the TAN value of 45, and stores the results the register DD50.

TAN(45) = 1

Advanced Function Instruction

FUN 214 <b>P</b> FLN	FLOATING POINT NAPIERIAN LOGARITHM, $\log_e x$ or $\ln(x)$	FUN 214 <b>P</b> FLN
-------------------------	--	-------------------------

S: Source data or register to be calculated Napierian logarithm value

D: Register for storing the result

S, D may combine with V, Z, P0~P9 to serve indirect address application

Range Ope- rand	HR	ROR	DR	K	XR
		R0   R3838	R5000   R8070	D0   D4094	Floating number
S	○	○	○	○	○
D	○	○*	○		○

Description

- The format of floating point number of WSZ-Controller follows the IEEE-754 standard of 32-bit.
- When operation control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, take the Napierian logarithm of the data specified by the S value or S~S+1 register, and store the result into the register specified by D~D+1.
- If the value of S is negative or equal to 0, invalid indirect addressing, or over range of the result , the error flag "ERR" will be set to 1, and not update the value of D~D+1.
- All floating point instructions can't be executed in interrupt service routine.

Example

- When M214=1, calculate the Napierian logarithm value, it is DD246 =  $\ln(DD46)$

<b>FUN 215 P</b> FEXP	FLOATING POINT NATURE POWER FUNCTION, $e^x$	<b>FUN 215 P</b> FEXP

D: Register for storing the result

S, D may combine with V, Z, P0~P9 to serve indirect address application

	Range	HR	ROR	DR	K	XR
Ope- rand		R0   R3838	R5000   R8070	D0   D4094	Floating number	V · Z   P0~P9
S		○	○	○	○	○
D		○	○*	○		○

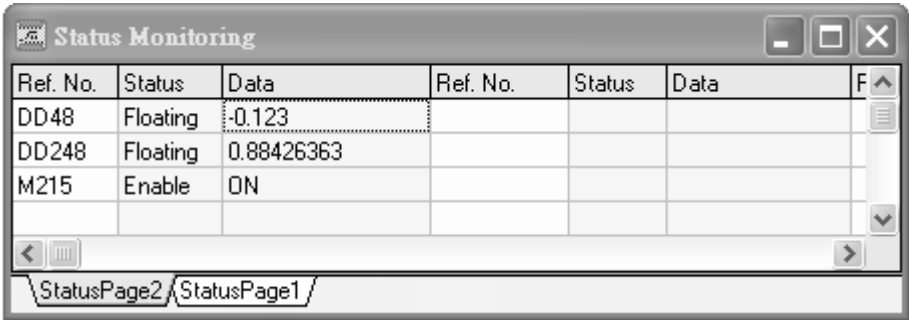

**Description**

- The format of floating point number of WSZ-Controller follows the IEEE-754 standard of 32-bit.
- When operation control "EN" =1 or "EN↑" (P instruction) changes from 0 to 1, calculate the nature power function of the data specified by the S value or S~S+1 register, and store the result into the register specified by D~D+1.
- If the value of S is out of range, invalid indirect addressing, or over range of the result , the error flag "ERR" will be set to 1, and not update the value of D~D+1.
- All floating point instructions can't be executed in interrupt service routine.

**Example**

- When M215=1, calculate the nature power function, it is DD248 =  $e^{DD48}$

## Description

- The format of floating point number of WSZ-Controller follows the IEEE-754 standard of 32-bit.
- When operation control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, calculate the logarithm value of the data specified by the S value or S~S+1 register, and store the result into the register specified by D~D+1.
- If the value of S is negative or equal to 0, invalid indirect addressing, or over range of the result, the error flag "ERR" will be set to 1, and not update the value of D~D+1.
- All floating point instructions can't be executed in interrupt service routine.

## Example

- When M216=1, calculate the logarithm value, it is DD250 =  $\log(DD50)$

**Description**

- The format of floating point number of WSZ-controller follows the IEEE-754 standard.
- When operation control "EN" =1 or "EN↑" (**P** instruction) changes from 0 to 1, calculate the absolute value of the floating point number register specified by D, and write it back into the original D register.

- The instruction at left calculates the absolute value of the DR0 register, and stores it back in DR0.

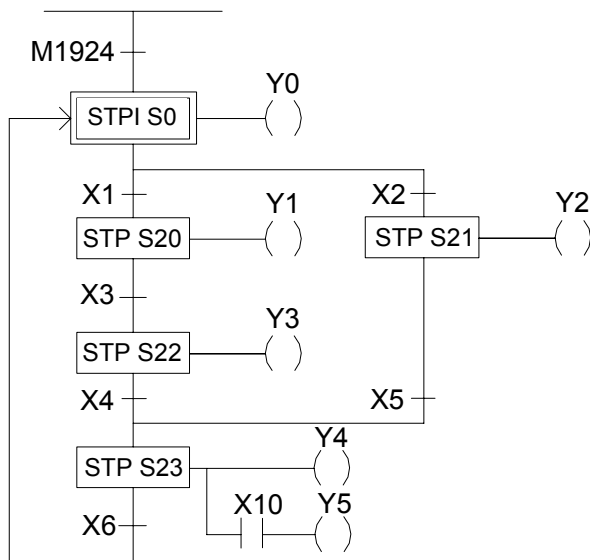

# Chapter 8 Step Instruction Description

Structured programming design is a major trend in software design. The benefits are high readability, easy maintenance, convenient updating and high quality and reliability. The control application which is consisted of many sequential tasks, and designed by conventional ladder program design methodology usually makes others hard to maintain. Therefore, it is necessary to combine the current widely used ladder diagrams with the sequential controls made especially for machine working flow. With help from step instructions, the design work will become more efficient, time saving and controlled. This kind of design method that combines process control and ladder diagram together is called the step ladder language.

The basic unit of step ladder diagram is a step. A step is equivalent to a movement (stop) in the machine operation where each movement has an output. The complete machine or the overall sequential control process is the combination of steps in serial or parallel. Its step-by-step sequential execution procedure allows others to be able to understand the machine operations thoroughly, so that design, operation, and maintenance will become more effective and simpler.

## 8.1 The Operation Principle of Step Ladder Diagram

### 【Example】

### 【Description】

1. **STP Sxxx** is the symbol representing a step Sxxx that can be one of S0 ~ S999. When executing the step (status ON), the ladder diagram on the right will be executed and the previous step and output will become OFF.
2. M1924 is on for a scan time after program start. Hence, as soon as ON, the initial step S0 is entered (S0 ON) while the other steps are kept inactive, i.e. Y1 ~ Y5 are all OFF. This means M1924 ON → S0 ON → Y0 ON and Y0 will remain ON until one of the contacts X1 or X2 is ON.
3. Assume that X2 is ON first; the path to S21 will then be executed.  

$$X2 \text{ ON} \Rightarrow \begin{cases} S21 \text{ ON} \\ S0 \text{ OFF} \end{cases} \Rightarrow \begin{cases} Y2 \text{ ON} \\ Y0 \text{ OFF} \end{cases}$$
Y2 will remain ON until X5 is ON.
4. Assume that X5 is ON, the process will move forward to step S23.  
i.e.  $X5 \text{ ON} \Rightarrow \begin{cases} S23 \text{ ON} \\ S21 \text{ OFF} \end{cases} \Rightarrow \begin{cases} Y4 \text{ ON} \\ Y2 \text{ OFF} \end{cases}$   
Y4 and Y5 will remain ON until X6 is ON.  
※If X10 is ON, then Y5 will be ON.
5. Assume that X6 is ON, the process will move forward to S0.  
i.e.  $X6 \text{ ON} \Rightarrow \begin{cases} S0 \text{ ON} \\ S23 \text{ OFF} \end{cases} \Rightarrow \begin{cases} Y0 \text{ ON} \\ Y4 \cdot Y5 \text{ OFF} \end{cases}$   
Then, a control process cycle is completed and the next control process cycle is entered.

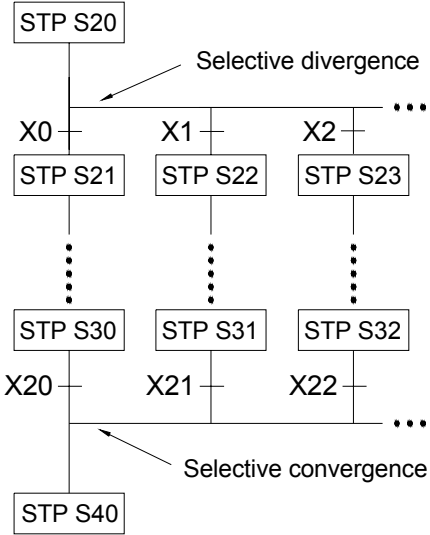

## 8.2 Basic Formation of Step Ladder Diagram

① Single path

- Step S20 alone moves to step S21 through X0.
- X0 can be changed to other serial or parallel combination of contacts.

② Selective divergence/convergence

- Step S20 selects an only one path which divergent condition first met. E.g. X2 is ON first, then only the path of step S23 will be executed.
- A divergence may have up to 8 paths maximum.
- X1, X2, ....., X22 can all be replaced by the serial or parallel combination of other contacts.

③ Simultaneous divergence/convergence

- After X0 is ON, step S20 will simultaneously execute all paths below it, i.e. all S21, S22, S23, and so on, are in action.
- All divergent paths at a convergent point will be executed to the last step (e.g. S30, S31 and S32). When X1 is ON, they can then transfer to S40 for execution.
- The number of divergent paths must be the same as the number of convergent paths. The maximum number of divergence/convergence path is 8.

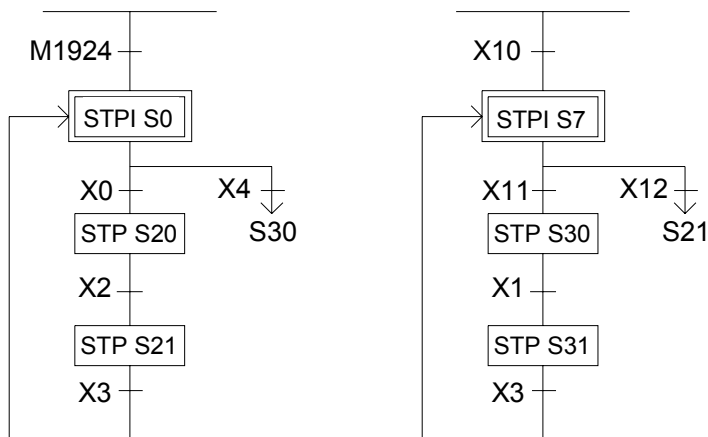

④ Jump

a. The same step loop

- There are 3 paths below step S20 as shown on the left. Assume that X2 is ON, then the process can jump directly to step S23 to execute without going through the process of selective convergence.
- The execution of simultaneous divergent paths can not be skipped.

b. Different step loop

⑤ Closed Loop and Single Cycle

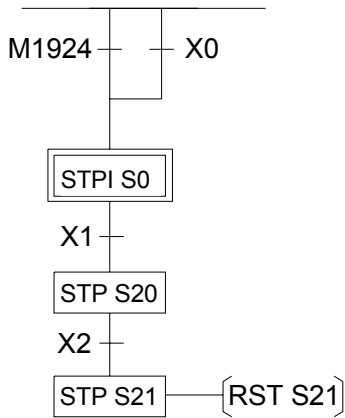

a. Closed Loop

- The initial step S1 is ON, endless cycle will be continued afterwards.

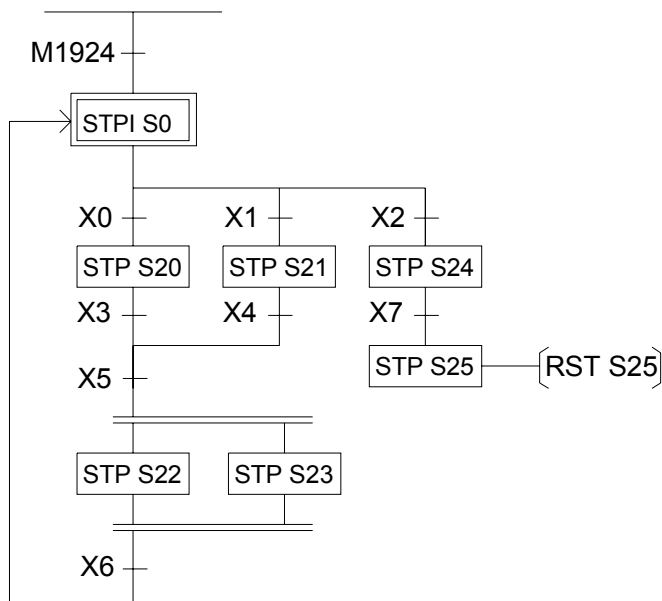

b. Single Cycle

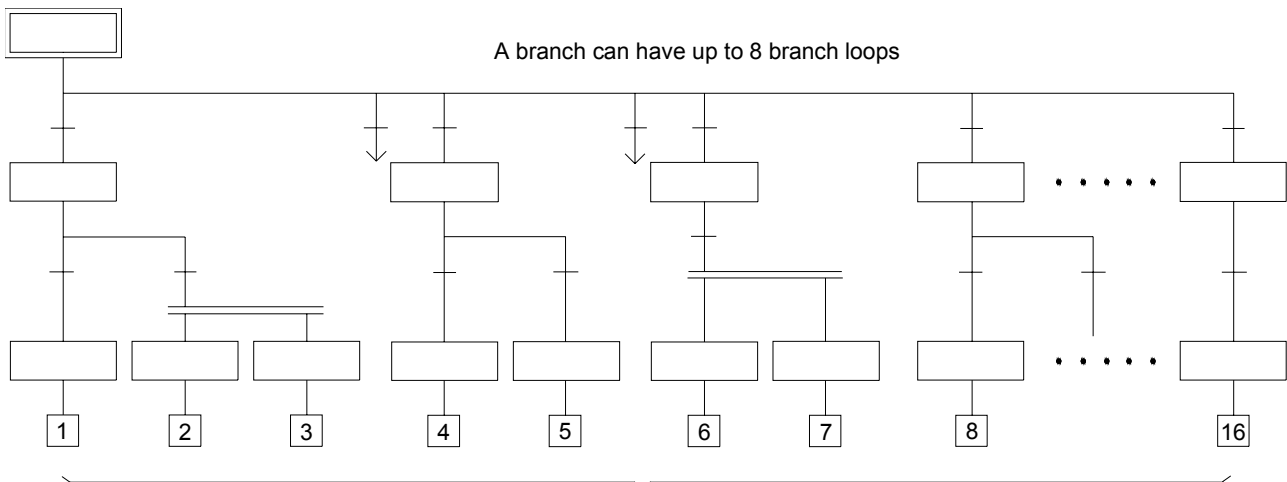

- When step S20 is ON, if X2 is also ON, then “RST S21” instruction will let S21 OFF which will stop the whole step process.

c. Mixed Process

⑥ Combined Application

The maximum number of downward horizontal branch loops of an initial step is 16

### 8.3 Introduction of Step Instructions: STPI, FROM, TO and STPEND

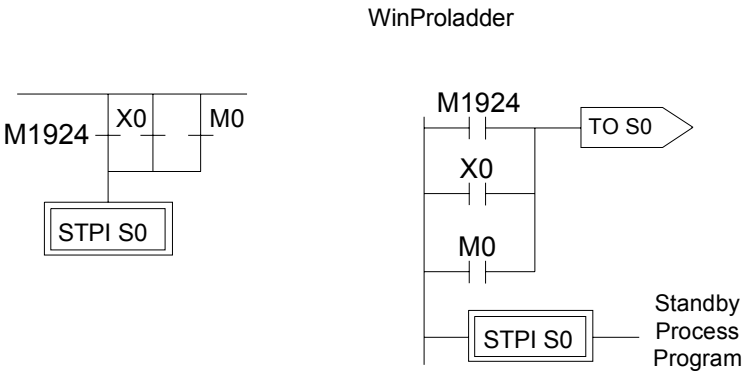

- **STPI Sx** :  $S0 \leq Sx \leq S7$  (Displayed in WinProladder)

This instruction is the initial step instruction from where the step control of each machine process can be derived. Up to 8 initial steps can be used in the WSZ series, i.e. a controller can make up to 8 process controls simultaneously. Each step process can operate independently or generate results for the reference of other processes.

**【Example 1】** Go to the initial step S0 after each start (ON)

**【Example 2】** Each time the device is start to run or the manual button is pressed or the device is malfunction, then the device automatically enters the initial step S0 to standby.

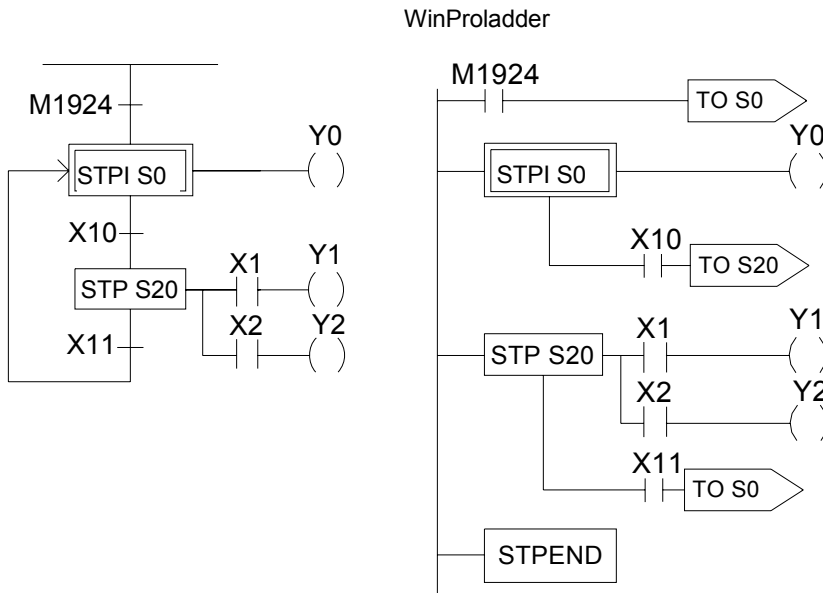

**【Description】** X0: Manual Button, M0: Abnormal Contact.

- **STP Sxxx** :  $S20 \leq Sxxx \leq S999$  (Displayed in WinProladder)

This instruction is a step instruction, each step in a process represents a step of sequence. If the status of step is ON then the step is active and will execute the ladder program associate to the step.

**【Example】**

**【Description】** 1. When ON, the initial step S0 is ON and Y0 is ON.

2. When transfer condition X10 is ON (in actual application, the transferring condition may be formed by the serial or parallel combination of the contacts X, Y, M, T and C), the step S20 is activated. The system will automatically turn S0 OFF in the current scan cycle and Y0 will be reset automatically to OFF.

$$\text{i.e. } X10 \text{ ON} \Rightarrow \begin{cases} S20 \text{ ON} \\ S0 \text{ OFF} \end{cases} \Rightarrow \begin{cases} X1 \text{ ON} \rightarrow Y1 \text{ ON} \\ X2 \text{ ON} \rightarrow Y2 \text{ ON} \\ Y0 \text{ OFF} \end{cases}$$

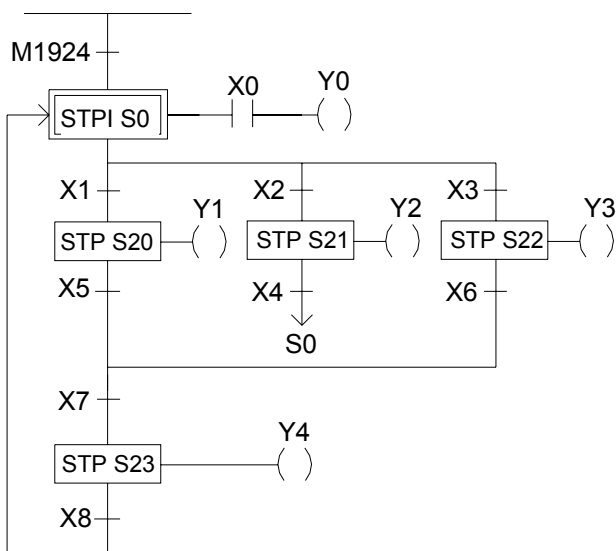

3. When the transfer condition X11 is ON, the step S0 is ON, Y0 is ON and S20, Y1 and Y2 will turn OFF at the same time.

$$\text{i.e. } X11 \text{ ON} \Rightarrow \begin{cases} S0 \text{ ON} \\ S20 \text{ OFF} \end{cases} \Rightarrow \begin{cases} Y0 \text{ ON} \\ Y1 \text{ OFF} \\ Y2 \text{ OFF} \end{cases}$$

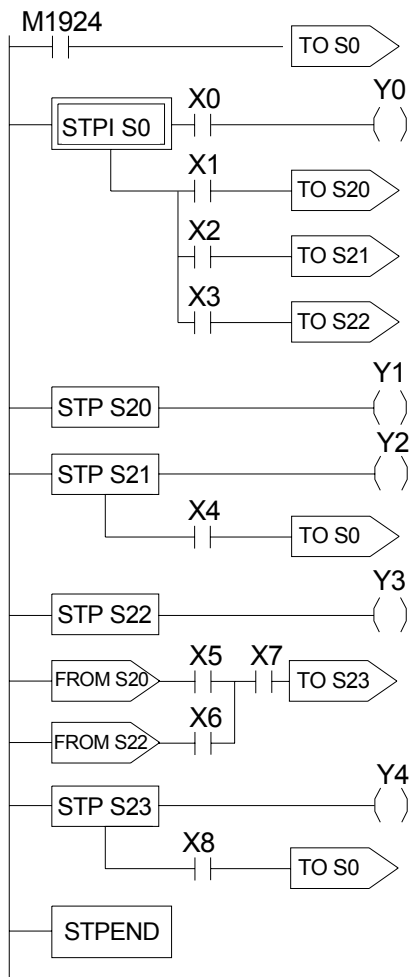

- FROM Sxxx :  $S0 \leq Sxxx \leq S999$  ( Displayed in WinProladder )

The instruction describes the source step of the transfer, i.e. moving from step Sxxx to the next step in coordination with transfer condition.

**【Example】**

WinProladder

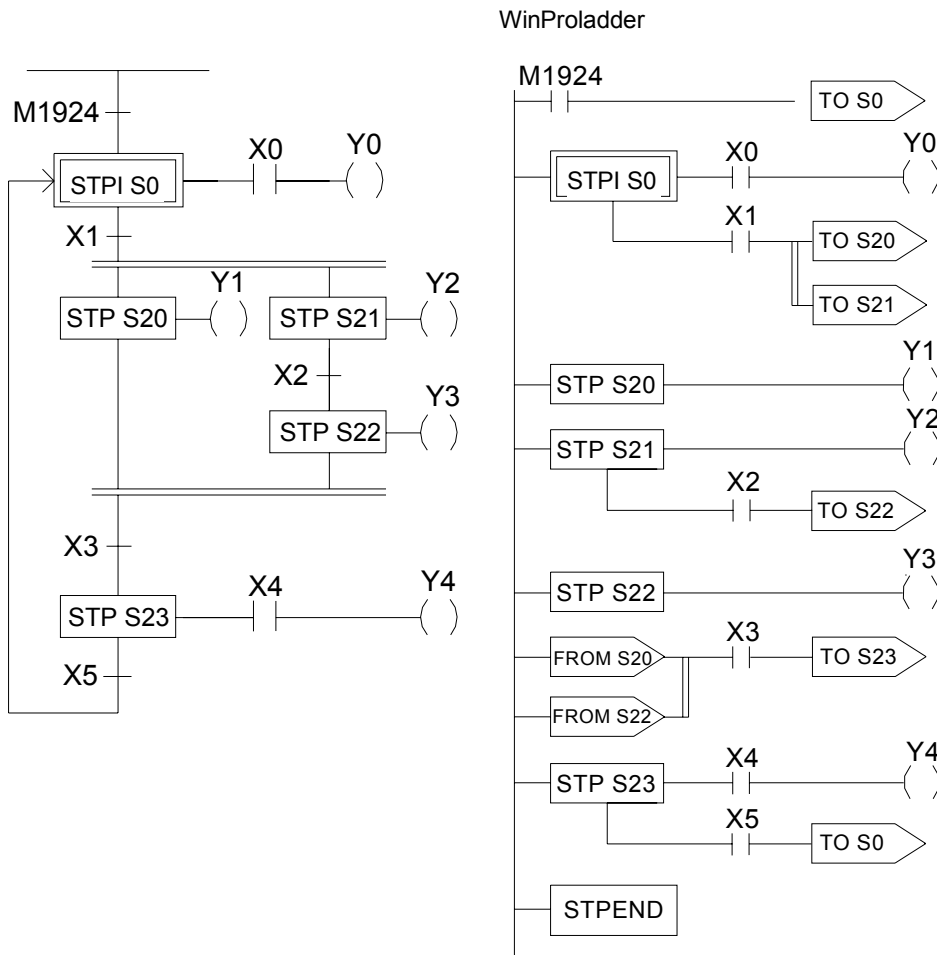

- 【Description】** : 1. When ON, the initial step S0 is ON. If X0 is ON, then Y0 will be ON.
2. When S0 is ON: a. if X1 is ON, then step S20 will be ON and Y1 will be ON.  
b. if X2 is ON, then step S21 will be ON and Y2 will be ON.  
c. if X3 is ON, then step S22 will be ON and Y3 will be ON.  
d. if X1, X2 and X3 are all ON simultaneous, then step S20 will have the priority to be ON first and either S21 or S22 will not be ON.  
e. if X2 and X3 are ON at the same time, then step S21 will have the priority to be ON first and S22 will not be ON.
3. When S20 is ON, if X5 and X7 are ON at the same time, then step S23 will be ON, Y4 will be ON and S20 and Y1 will be OFF.
4. When S21 is ON, if X4 is ON, then step S0 will be ON and S21 and Y2 will be OFF.
5. When S22 is ON, if X6 and X7 are ON at the same time, then step S23 will be ON, Y4 will be ON and S22 and Y3 will be OFF.
6. When S23 is ON, if X8 is ON, then step S0 will be ON and S23 and Y4 will be OFF.

- **TO Sxxx** :  $S0 \leq Sxxx \leq S999$  (Displayed in WinProladder)

This instruction describes the step to be transferred to.

**【Example】**

**【Description】** : 1. When ON, the initial step S0 is ON. If X0 is ON, then Y0 will be ON.

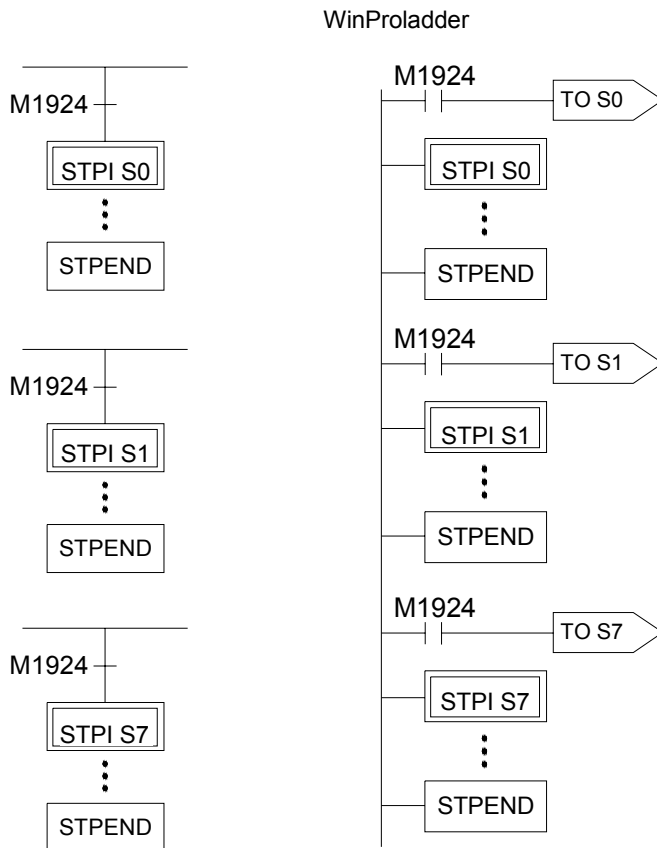

2. When S0 is ON: if X1 is ON, then steps S20 and S21 will be ON simultaneously and Y1 and Y2 will also be ON.
3. When S21 is ON: if X2 is ON, then step S22 will be ON, Y3 will be ON and S21 and Y2 will be OFF.
4. When S20 and S22 are ON at the same time and the transferring condition X3 is ON, then step S23 will be ON (if X4 is ON, then Y4 will be ON) and S20 and S22 will automatically turn OFF and Y1 and Y3 will also turn OFF.
5. When S23 is ON: if X5 is ON, then the process will transfer back to the initial step, i.e. S0 will be ON and S23 and Y4 will be OFF.

● STPEND : ( Displayed in WinProladder )

This instruction represents the end of a process. It is necessary to include this instruction so all processes can be operated correctly.

A controller can have up to 8 step processes (S0~S7) and is able to control them simultaneously. Therefore, up to 8 STPEND instructions can be obtained.

【Example】

【Description】 When ON, the 8 step processes will be active simultaneously.

## 8.4 Notes for Writing a Step Ladder Diagram

### 【Notes】

- In actual applications, the ladder diagram can be used together with the step ladder.
- There are 8 steps, S0~S7, that can be used as the starting point and are called the “initial steps”.
- When controller starts operating, it is necessary to activate the initial step. The M1924 (the first scan ON signal) provided by the system may be used to activate the initial step.
- Except the initial step, the start of any other steps must be driven by other step.
- It is necessary to have an initial step and the final STPEND instruction in a step ladder diagram to complete a step process program.
- There are 980 steps, S20~S999, available that can be used freely. However, used numbers cannot be repeated. S500~S999 are retentive(The range can be modified by users), can be used if it is required to continue the machine process after power is off.
- Basically a step must consists of three parts which are control output, transition conditions and transition targets.
- MC and SKP instructions cannot be used in a step program and the sub-programs. It's recommended that JMP instruction should be avoided as much as possible.
- If the output point is required to stay ON after the step is divergent to other step, it is necessary to use the SET instruction to control the output point and use RST instruction to clear the output point to OFF.
- Looking down from an initial step, the maximum number of horizontal paths is 16. However, a step is only allowed to have up to 8 branch paths.
- When M1918=0 (default) , if a PULSE type function instruction is used in master control loop (FUN 0) or a step program, it is necessary to connect a TU instruction before the function instruction. For example,

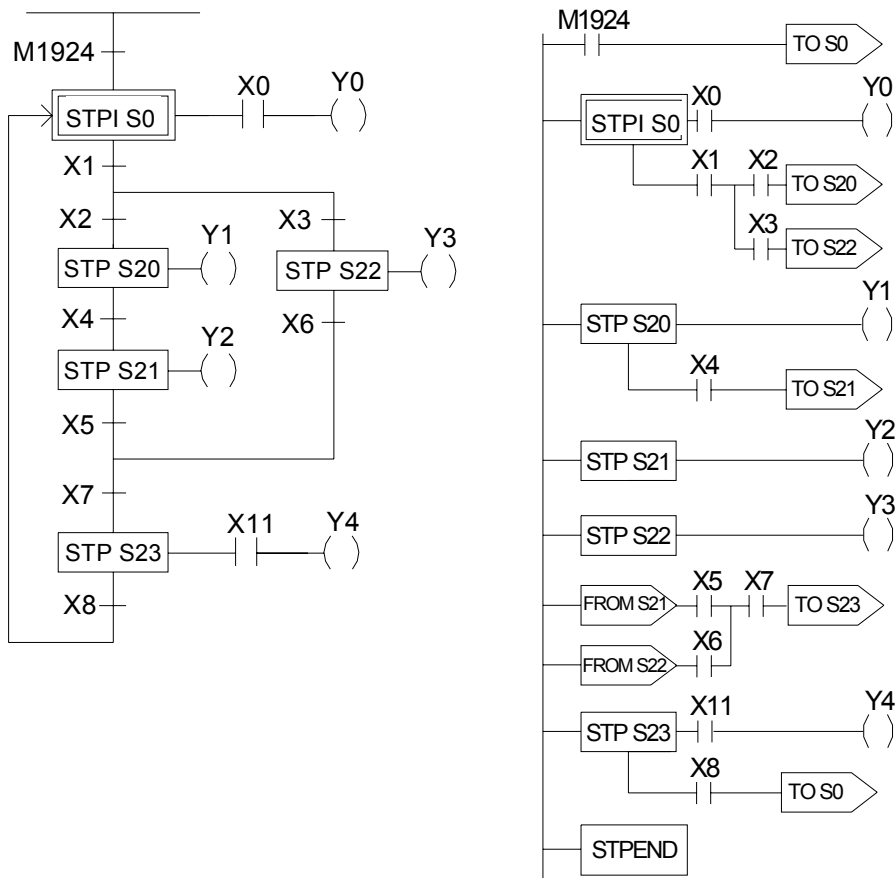

When M1918=1, the TU instruction is not required, e.g.:

**Example 2**

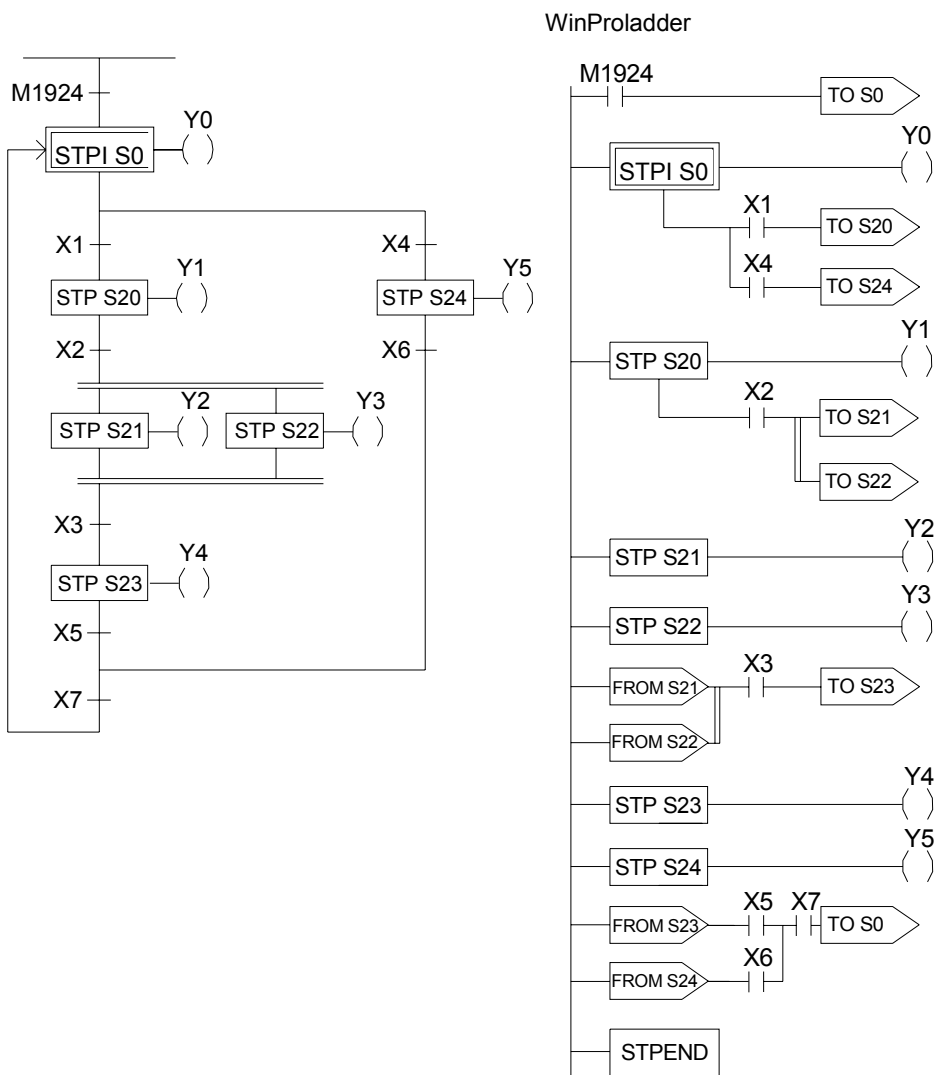

WinProladder

**Description**

1. Input the condition to initial step S0
2. Input the S0 and the divergent condition of S20 and S22
3. Input the S20
4. Input the S21
5. Input the S22
6. Input the convergence of S21 and S22
7. Input the S23

**Example 3**

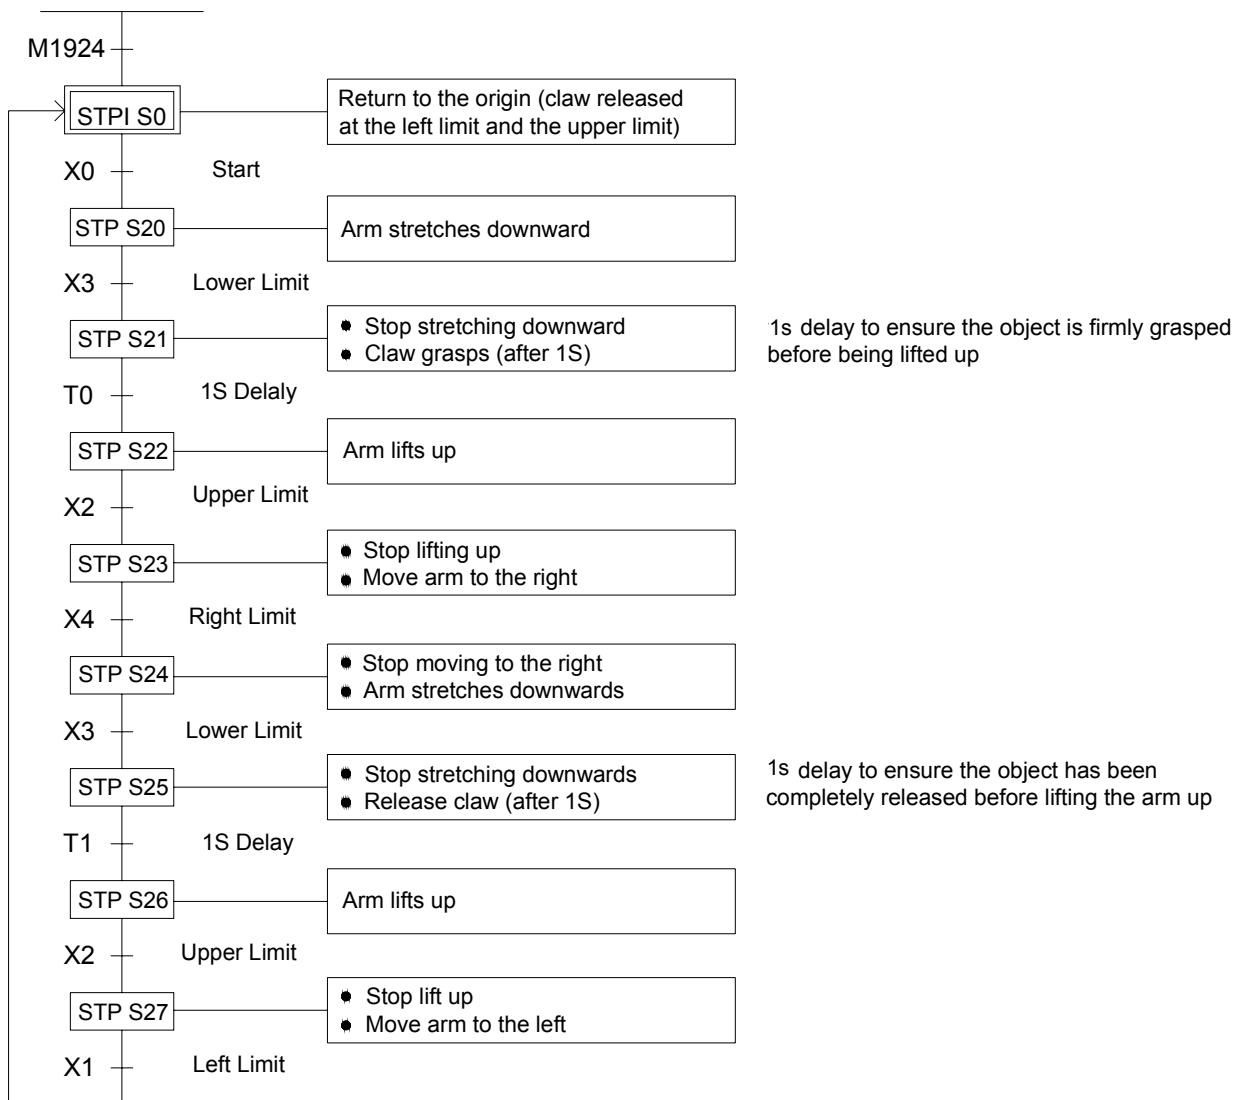

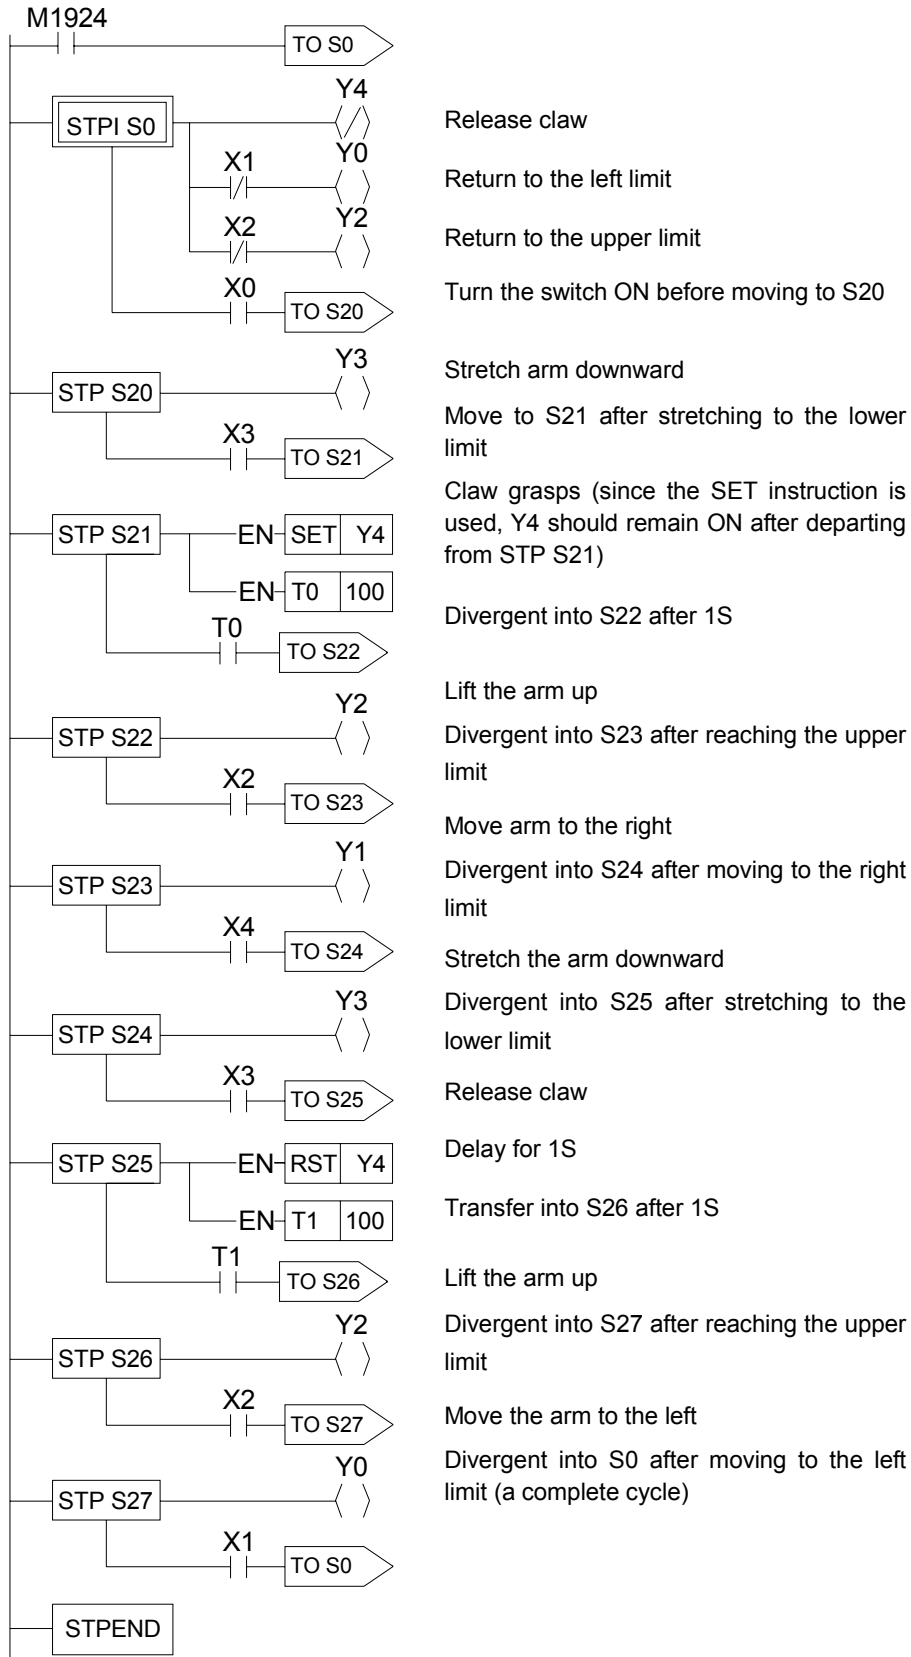

**Description**

1. Input the condition to initial step S0
2. Input the S0 and the divergences of S20 and S24
3. Input the S20
4. Input the S20 and the divergences of S21 and S22
5. Input the S21
6. Input the S22
7. Input the convergences of S21 and S22
8. Input the S23
9. Input the S24
10. Input the convergences of S23 and S24

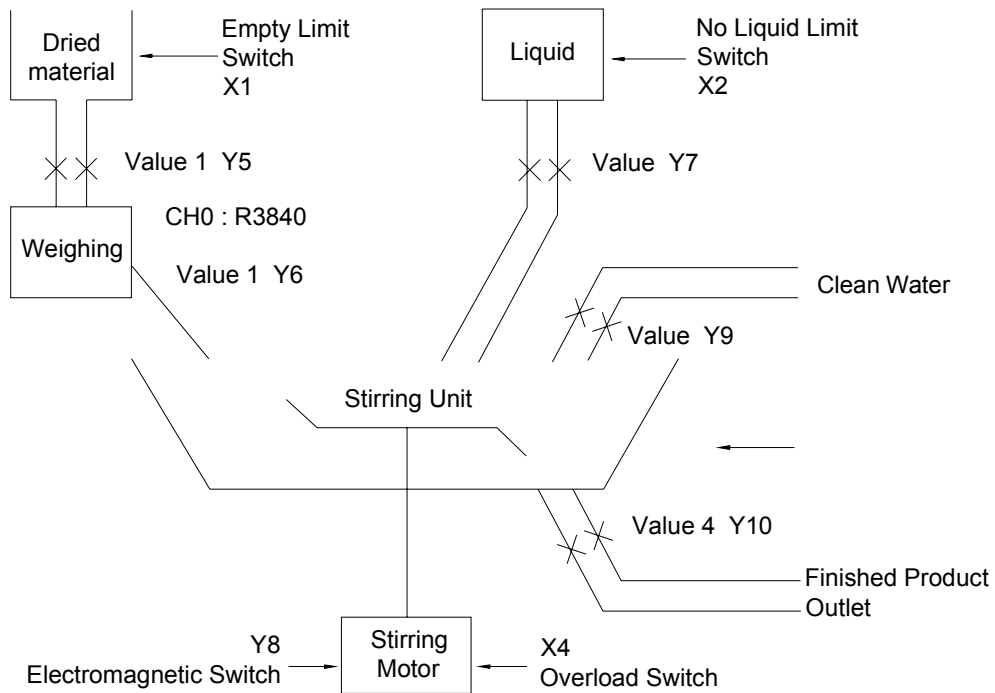

## 8.5 Application Examples

### Example 1 Grasp an object from tank A and put it in Tank B

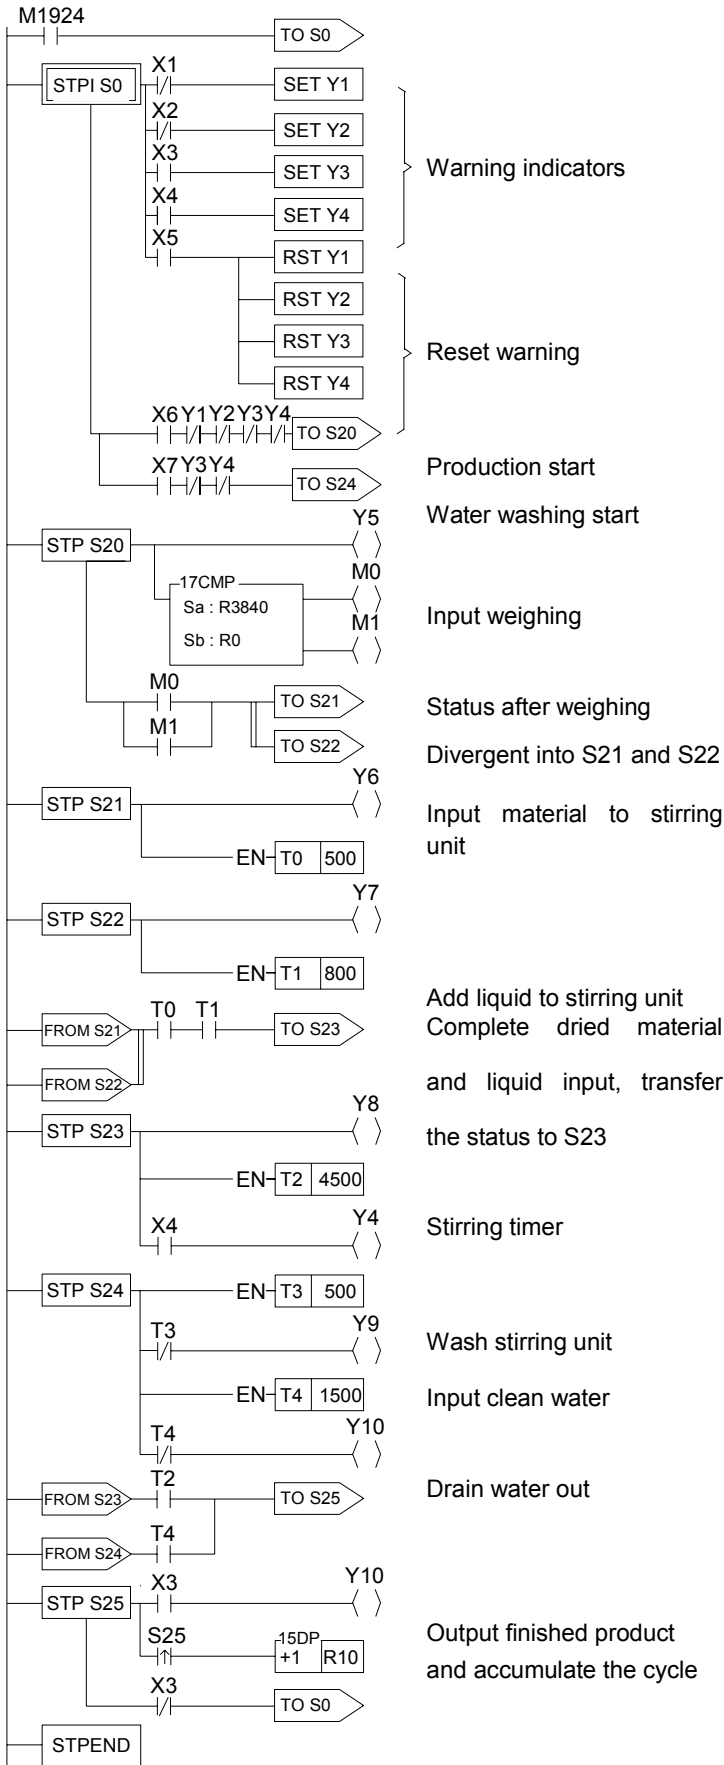

**Example 2** Liquid Stirring Process

- Input Points: Empty limit switch X1  
No liquid limit switch X2  
Empty limit switch X3  
Over-load switch X4  
Warning clear button X5  
Start button X6  
Water washing button X7
- Warning Indicators: Empty dried material Y1  
Insufficient liquid Y2  
Empty stirring unit Y3  
Motor over-load Y4
- Output Points: Dried material inlet valve Y5  
Dried material inlet valve Y6  
Liquid inlet valve Y7  
Motor start electromagnetic valve Y8  
Clean water inlet valve Y9  
Finished product outlet valve Y10
- Weighing Output: CH0 ( R3840 )
- M1918=0

WinProLadder

**Example 3** Pedestrian Crossing Lights

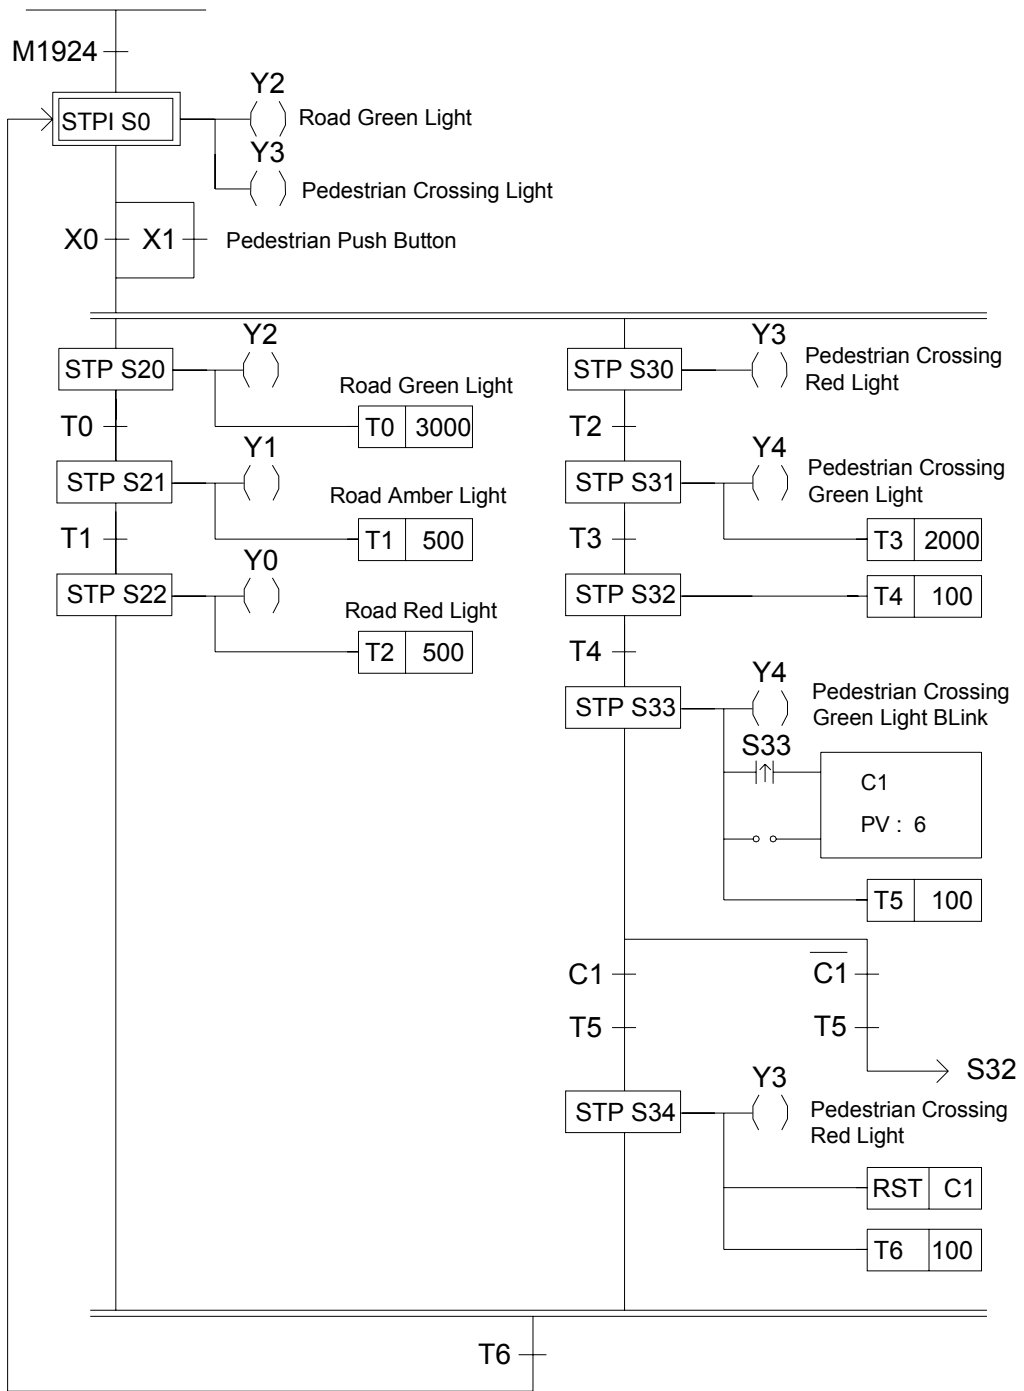

- ♦ Input Points: Pedestrian Push Button X0  
Pedestrian Push Button X1

- ♦ Output Points: Road Red Light Y0  
Road Amber light Y1  
Road Green Light Y2  
Pedestrian Crossing Red Light Y3  
Pedestrian Crossing Green Light Y4

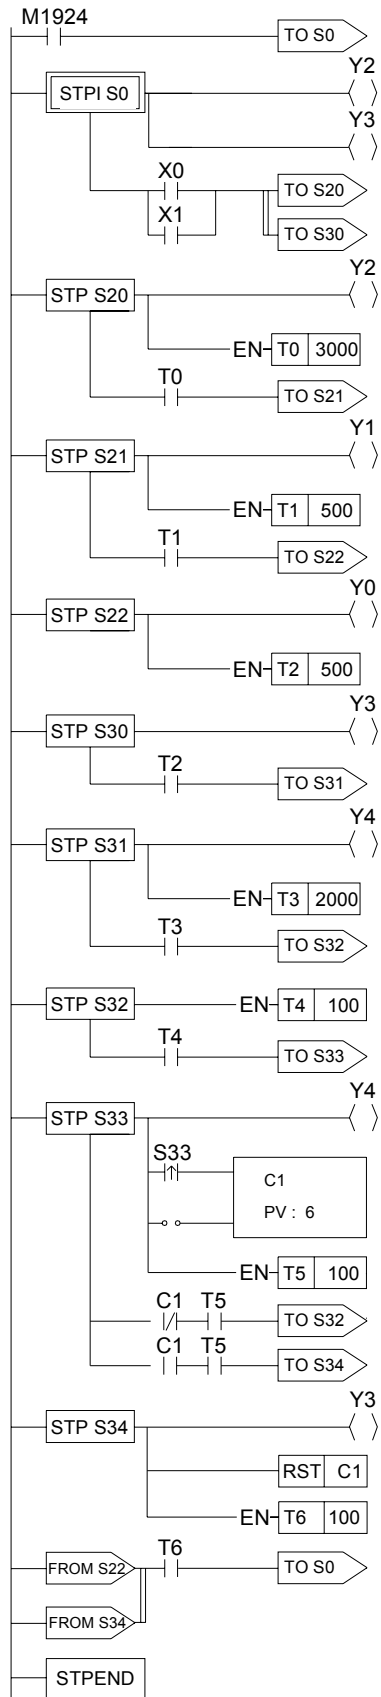

- ♦ M1918=0

## 8.6 Syntax Check Error Codes for Step Instruction

The error codes for the usage of step instruction are as follows:

- E51 : TO (S0-S7) must begin with ORG instruction.
- E52 : TO (S20-S999) can't begin with ORG instruction.
- E53 : TO instruction without matched FROM instruction.
- E54 : To instruction must come after TO, AND, OR, ANDLD or ORLD instruction.
- E56 : The instructions before FROM must be AND, OR, ANDLD or ORLD
- E57 : The instruction after FROM can't be a coil or a function
- E58 : Coil or function must be before FROM while in STEP network.
- E59 : More than 8 TO# at same network.
- E60 : More than 8 FROM# at same network.
- E61 : TO (S0-S7) must locate at first row of the network.
- E62 : A contact occupies the location for TO instruction.
- E71 : Linked incomplete. (Should not occur)
- E72 : Duplicated TO Sxx instruction.
- E73 : Duplicated STP sxx instruction.
- E74 : Duplicated FROM sxx instruction.
- E76 : STP (S0~S7) without a matched STPEND or STPEND without a matched STP (S0~S7).
- E77 : STP (S0 - S19) before a network is not based on ORG start only the TO (S0 - S19).
- E78 : TO (S20~S999), STP (S20~S999) or FROM instructions come before or without STP (S0~S19).
- E79 : STP Sxx or FROM Sxx instructions come before or without TO Sxx.
- E80 : FROM Sxx instruction comes before or without STP Sxx.
- E81 : The max. level of branches must  $\leq 16$ .
- E82 : The max. no. of branches with same level must  $\leq 16$ .
- E83 : Not place the step instruction with TO->STP->FROM sequence.
- E84 : The definition of STP# sequence not follow the TO# sequence.
- E85 : Convergence does not match the corresponding divergence.
- E86 : Illegal usage of STP or FROM before convergent with TO instruction.
- E87 : STP# or FROM# comes before corresponding TO#.
- E88 : During this branch, STP# or FROM# comes before the corresponding TO#.
- E89 : FROM# comes before corresponding TO# or STP#.
- E90 : Invalid To# usage in the simultaneous branch.
- E91 : Flow control function can not be used in the step ladder region.
